## Abstract

Many architects struggle with a given large code-base, where a lot of knowledge about the code is in the head of people or worse where the knowledge has disappeared. One of the means to recover insight from a code base is by measuring and instrumenting the code-base. This presentation addresses measurements of the static aspects of the code, as well as instrumentation to obtain insight in the dynamic aspects of the code.

## Distribution

This article or presentation is written as part of the Gaudí project. The Gaudí project philosophy is to improve by obtaining frequent feedback. Frequent feedback is pursued by an open creation process. This document is published as intermediate or nearly mature version to get feedback. Further distribution is allowed as long as the document remains complete and unchanged.

# Memory Instrumentation

# Overview of Benchmarks and Other Measurement Tools

	test / benchmark	what, why	accuracy	when
<i>public</i>	SpecInt (by suppliers)	CPU integer	coarse	new hardware
	Byte benchmark	computer platform performance OS, shell, file I/O	coarse	new hardware new OS release
<i>self made</i>	file I/O	file I/O throughput	medium	new hardware
	image processing	CPU, cache, memory as function of image, pixel size	accurate	new hardware
	Objective-C overhead	method call overhead memory overhead	accurate	initial
	socket, network	throughput CPU overhead	accurate	ad hoc
	data base	transaction overhead query behaviour	accurate	ad hoc
	load test	throughput, CPU, memory	accurate	regression

# Tools and Instruments Positioned in the Stack

# Case 2: ARM9 Cache Performance

# Example Hardware Performance

memory access time in case of a cache miss  
200 Mhz, 5 ns cycle: 190 ns

## ARM9 200 MHz $t_{\text{context switch}}$ as function of cache use

cache setting	$t_{\text{context switch}}$
From cache	2 $\mu\text{s}$
After cache flush	10 $\mu\text{s}$
Cache disabled	50 $\mu\text{s}$

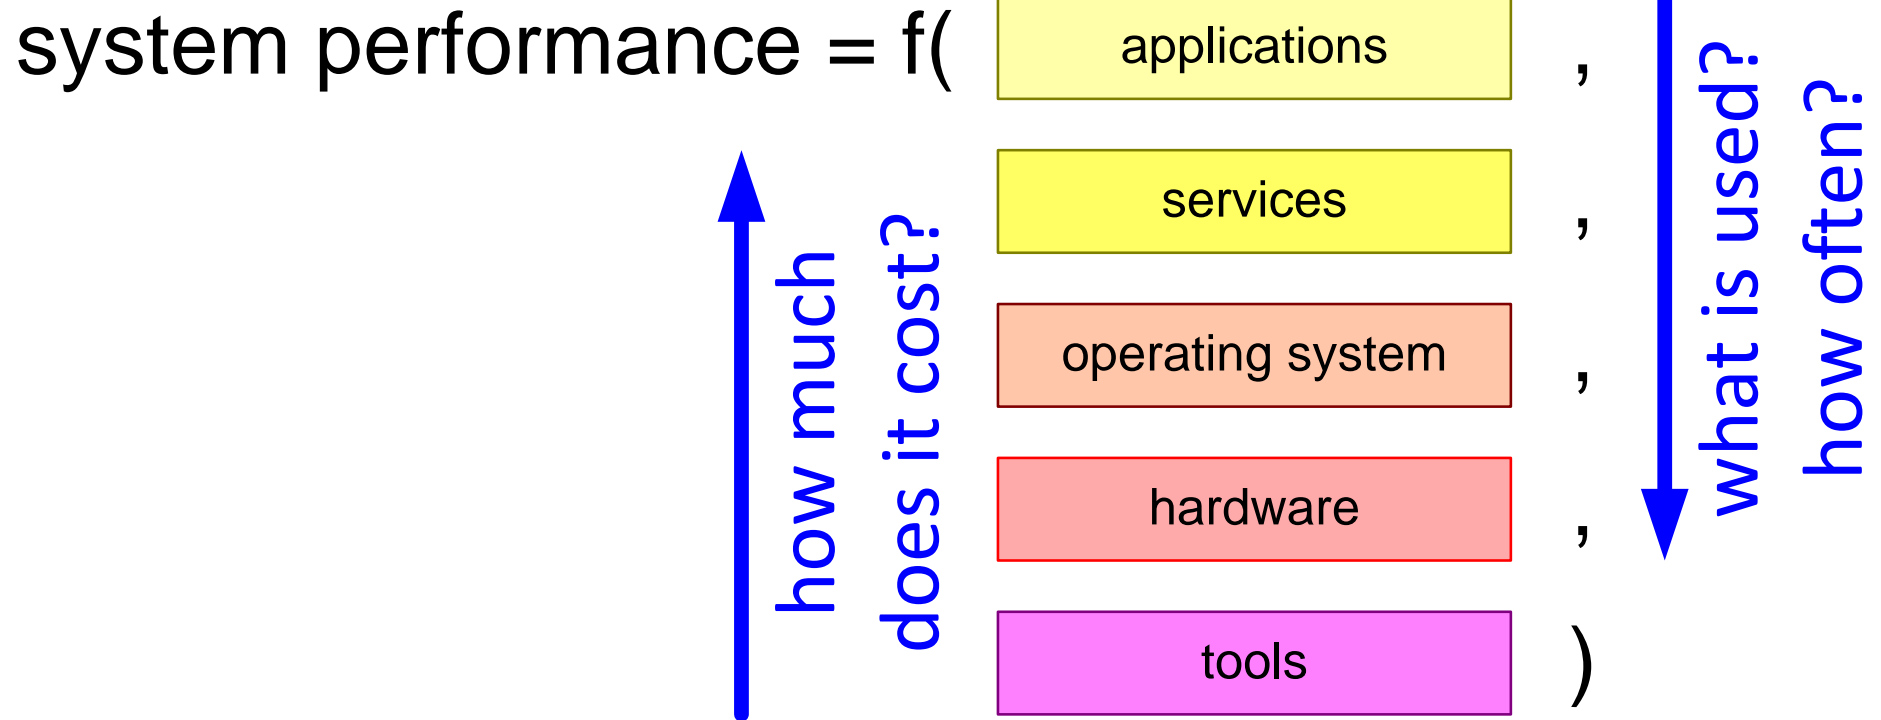

# Context Switch Overhead

$$t_{\text{overhead}} = n_{\text{context switch}} * t_{\text{context switch}}$$

$n_{\text{context switch}}$ ( $s^{-1}$ )	$t_{\text{context switch}} = 10\mu s$		$t_{\text{context switch}} = 2\mu s$	
	$t_{\text{overhead}}$	CPU load overhead	$t_{\text{overhead}}$	CPU load overhead
500	5ms	0.5%	1ms	0.1%
5000	50ms	5%	10ms	1%
50000	500ms	50%	100ms	10%

# Performance as Function of all Layers

# Annotated Performance Formule

system performance = f(

applications	hit-rate, miss-rate, #transactions interrupt-rate, task switch rate CPU-load	,
services	transaction overhead: 25 ms	,
operating system	interrupt latency: 10 us task-switch: 10 us (with cache flush)	,
hardware	cache miss: 190ns	,
tools		)

# Keep iterating!

0. many design teams have lost the overview of the system
1. a good (sw) architect has a quantified understanding of system context, system and software
2. a good design facilitates measurements of critical aspects for a small realization effort
