## Abstract

This presentation uses a web shop service as example system to construct a system model. The caching of pictures of the products in the shop is modeled to analyze performance, robustness, scalability and reliability of the system.

### Distribution

This article or presentation is written as part of the Gaudí project. The Gaudí project philosophy is to improve by obtaining frequent feedback. Frequent feedback is pursued by an open creation process. This document is published as intermediate or nearly mature version to get feedback. Further distribution is allowed as long as the document remains complete and unchanged.

## *content*

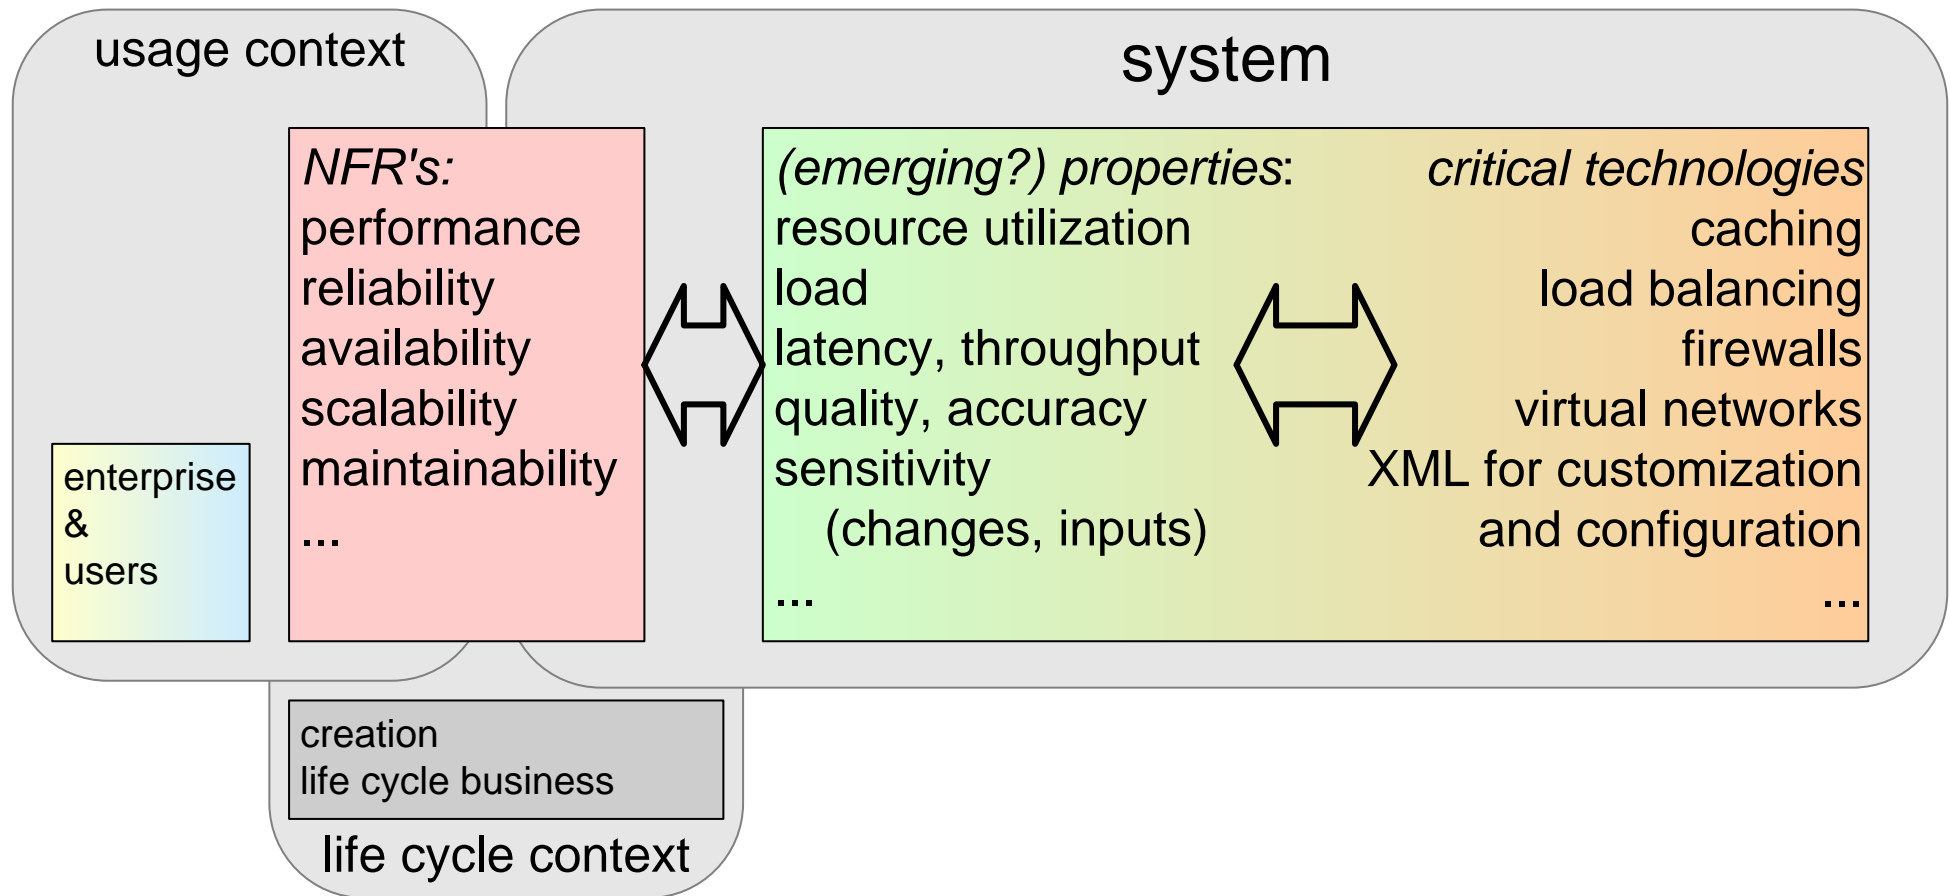

What to model of the system

Stepwise approach to system modeling

Non Functional requirements (NFR), System Properties and Critical Technologies

Examples of web shop case

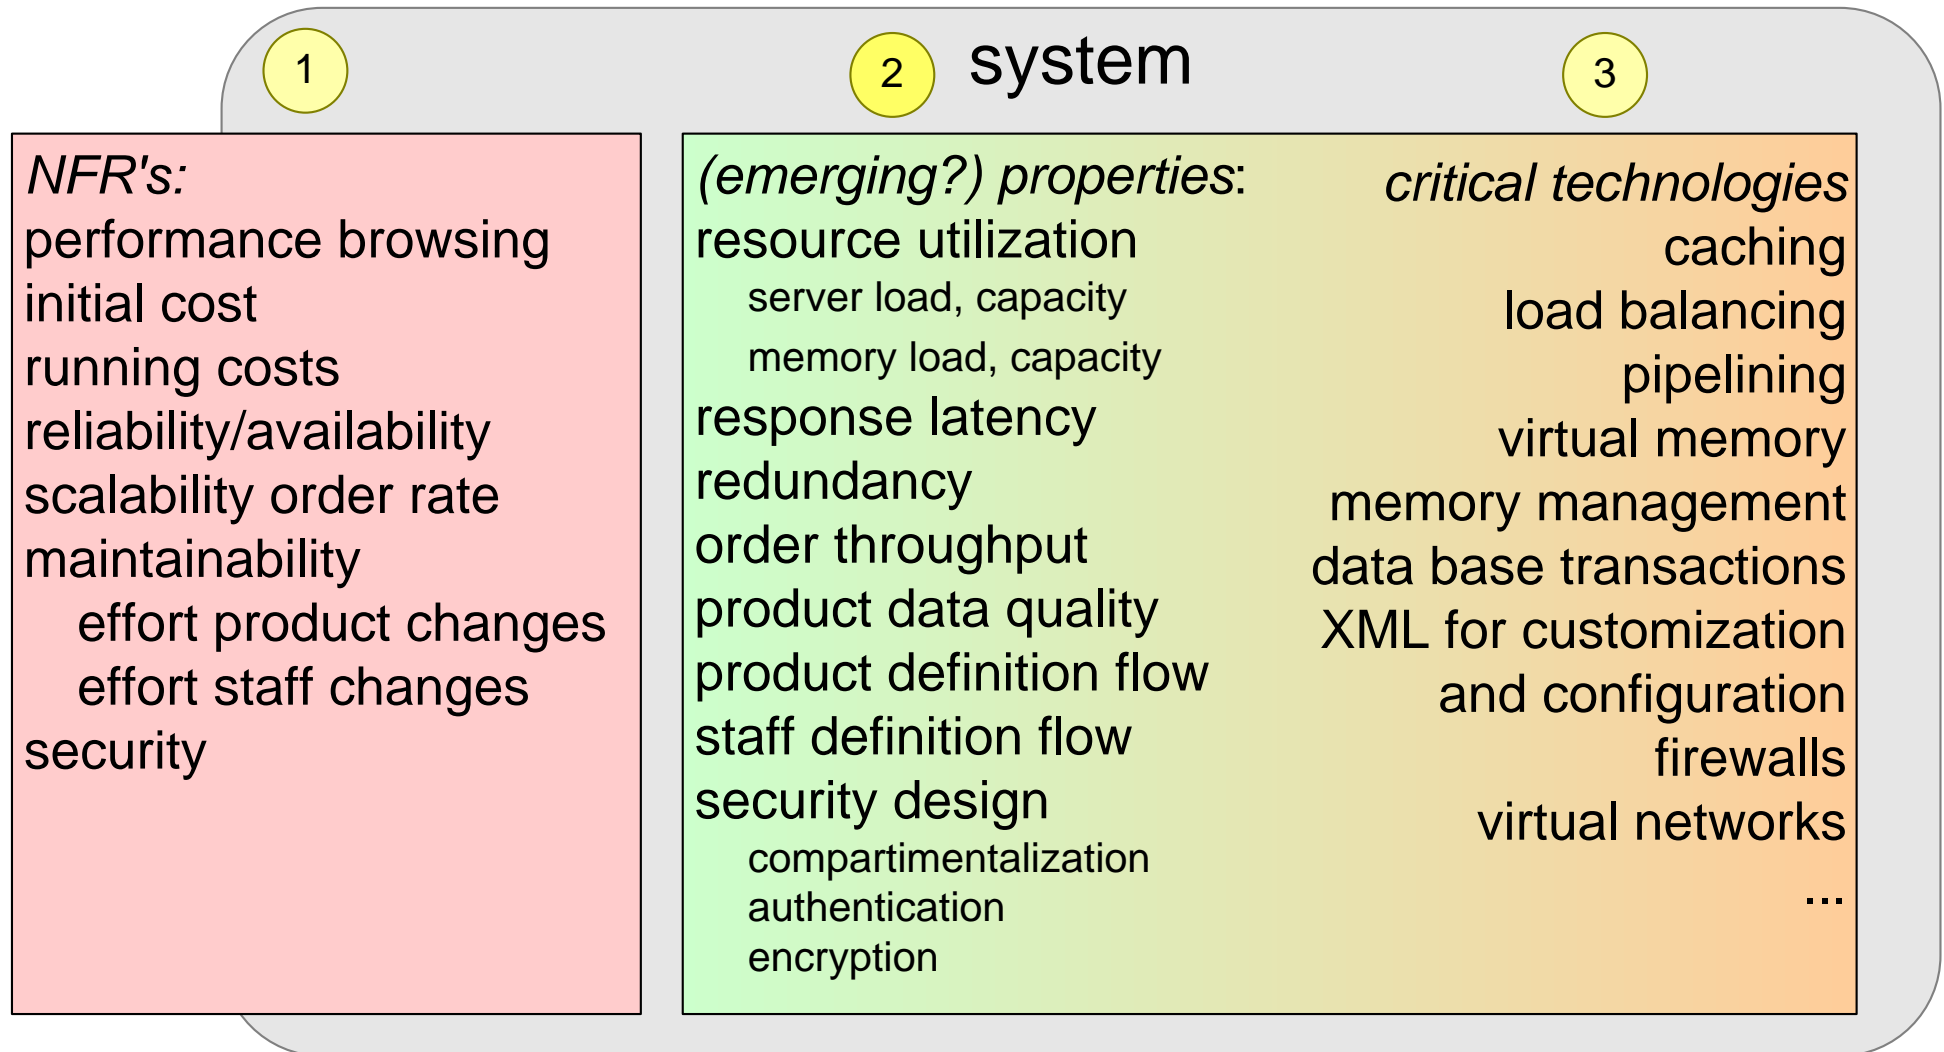

# What to Model in System Context?

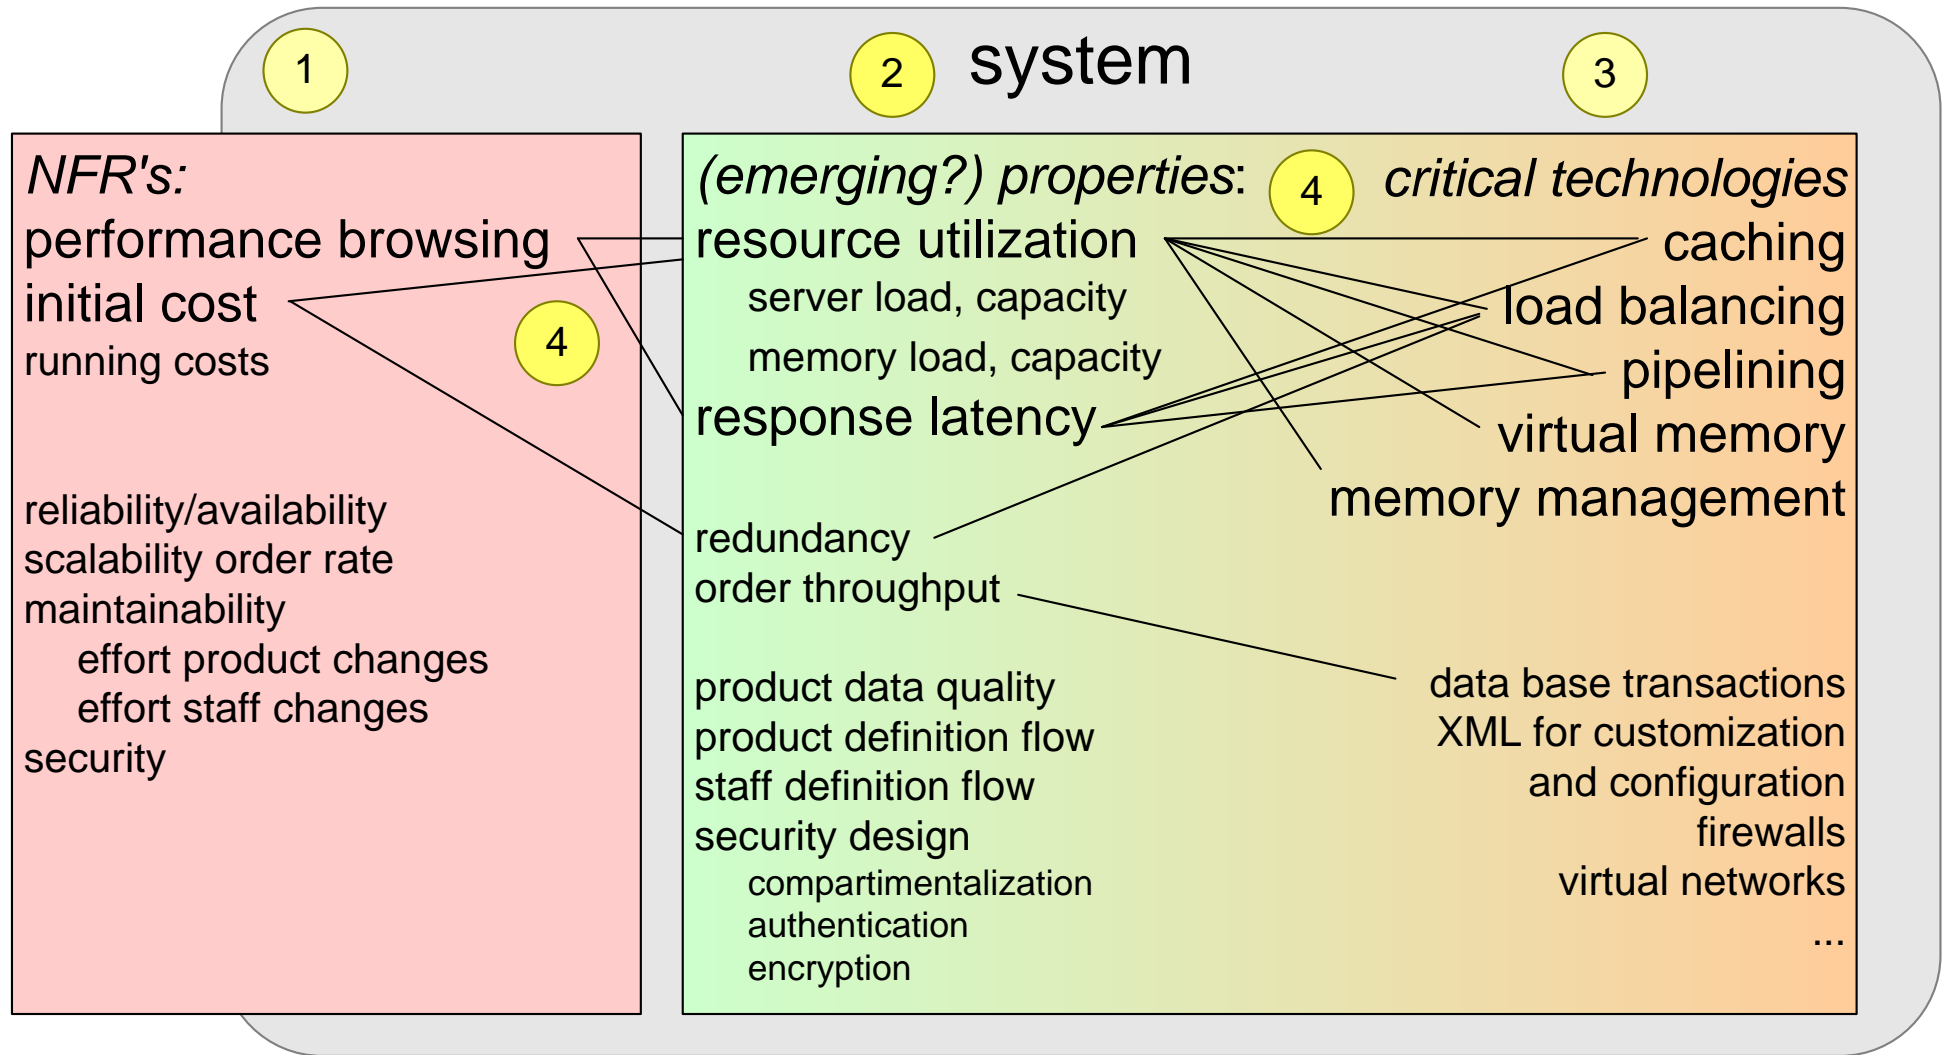

# Approach to System Modeling

1. determine relevant Non Functional Requirements (NFR's)
2. determine relevant system design properties
3. determine critical technologies
4. relate NFR's to properties to critical technologies
5. rank the relations in relevancy and criticality
6. model relations with a high score

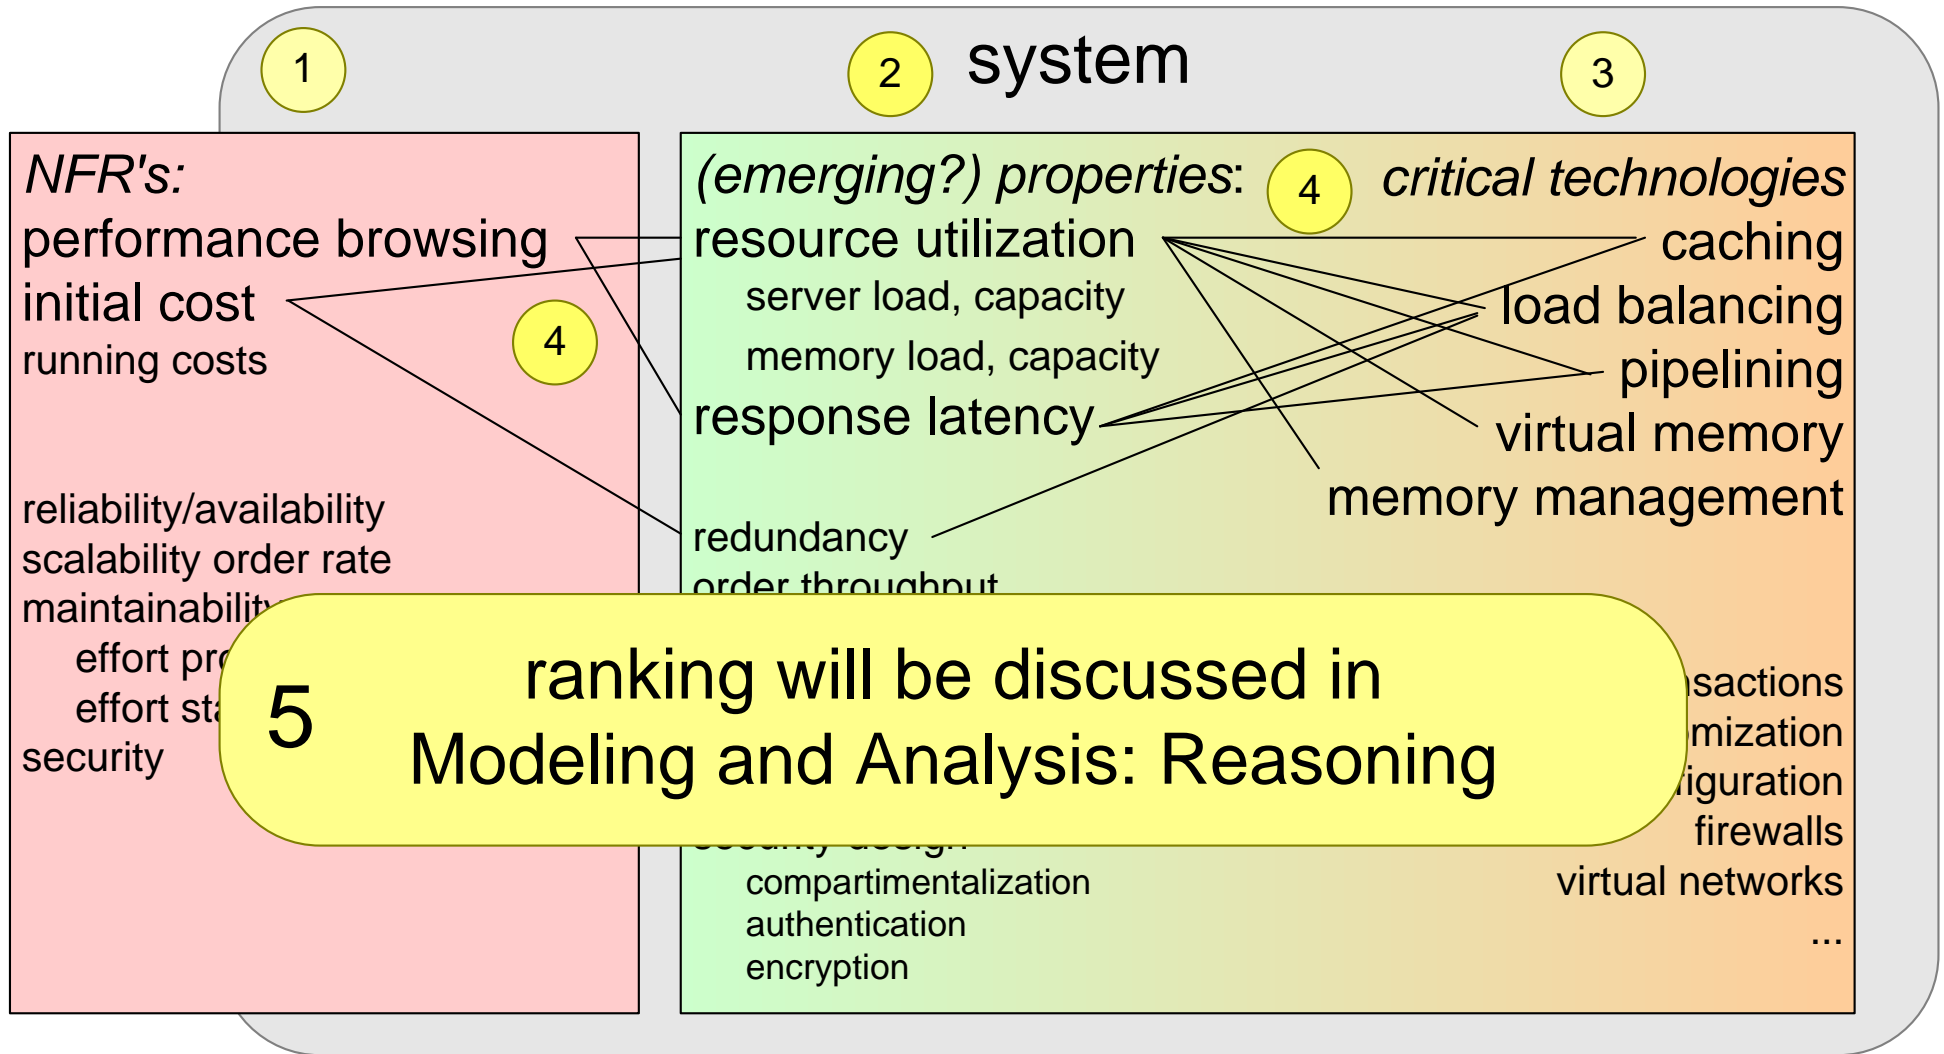

# Web Shop: NFR's, Properties and Critical Technologies

# 4. Determine Relations

# 5. Rank Relations

# Purpose of Picture Cache Model in Web Shop Context

*zero order web server load model*

$$\text{Load} = n_a * t_a$$

$n_a$  = total requests

$t_a$  = cost per request

# First Order Load Model

*first order web server load model*

$$\text{Load} = n_{a,h} * t_h + n_{a,m} * t_m$$

$n_{a,h}$  = accesses with cache hit

$n_{a,m}$  = accesses with cache miss

$t_h$  = cost of cache hit

$t_m$  = cost of cache miss

$$n_{a,h} = n_a * h$$

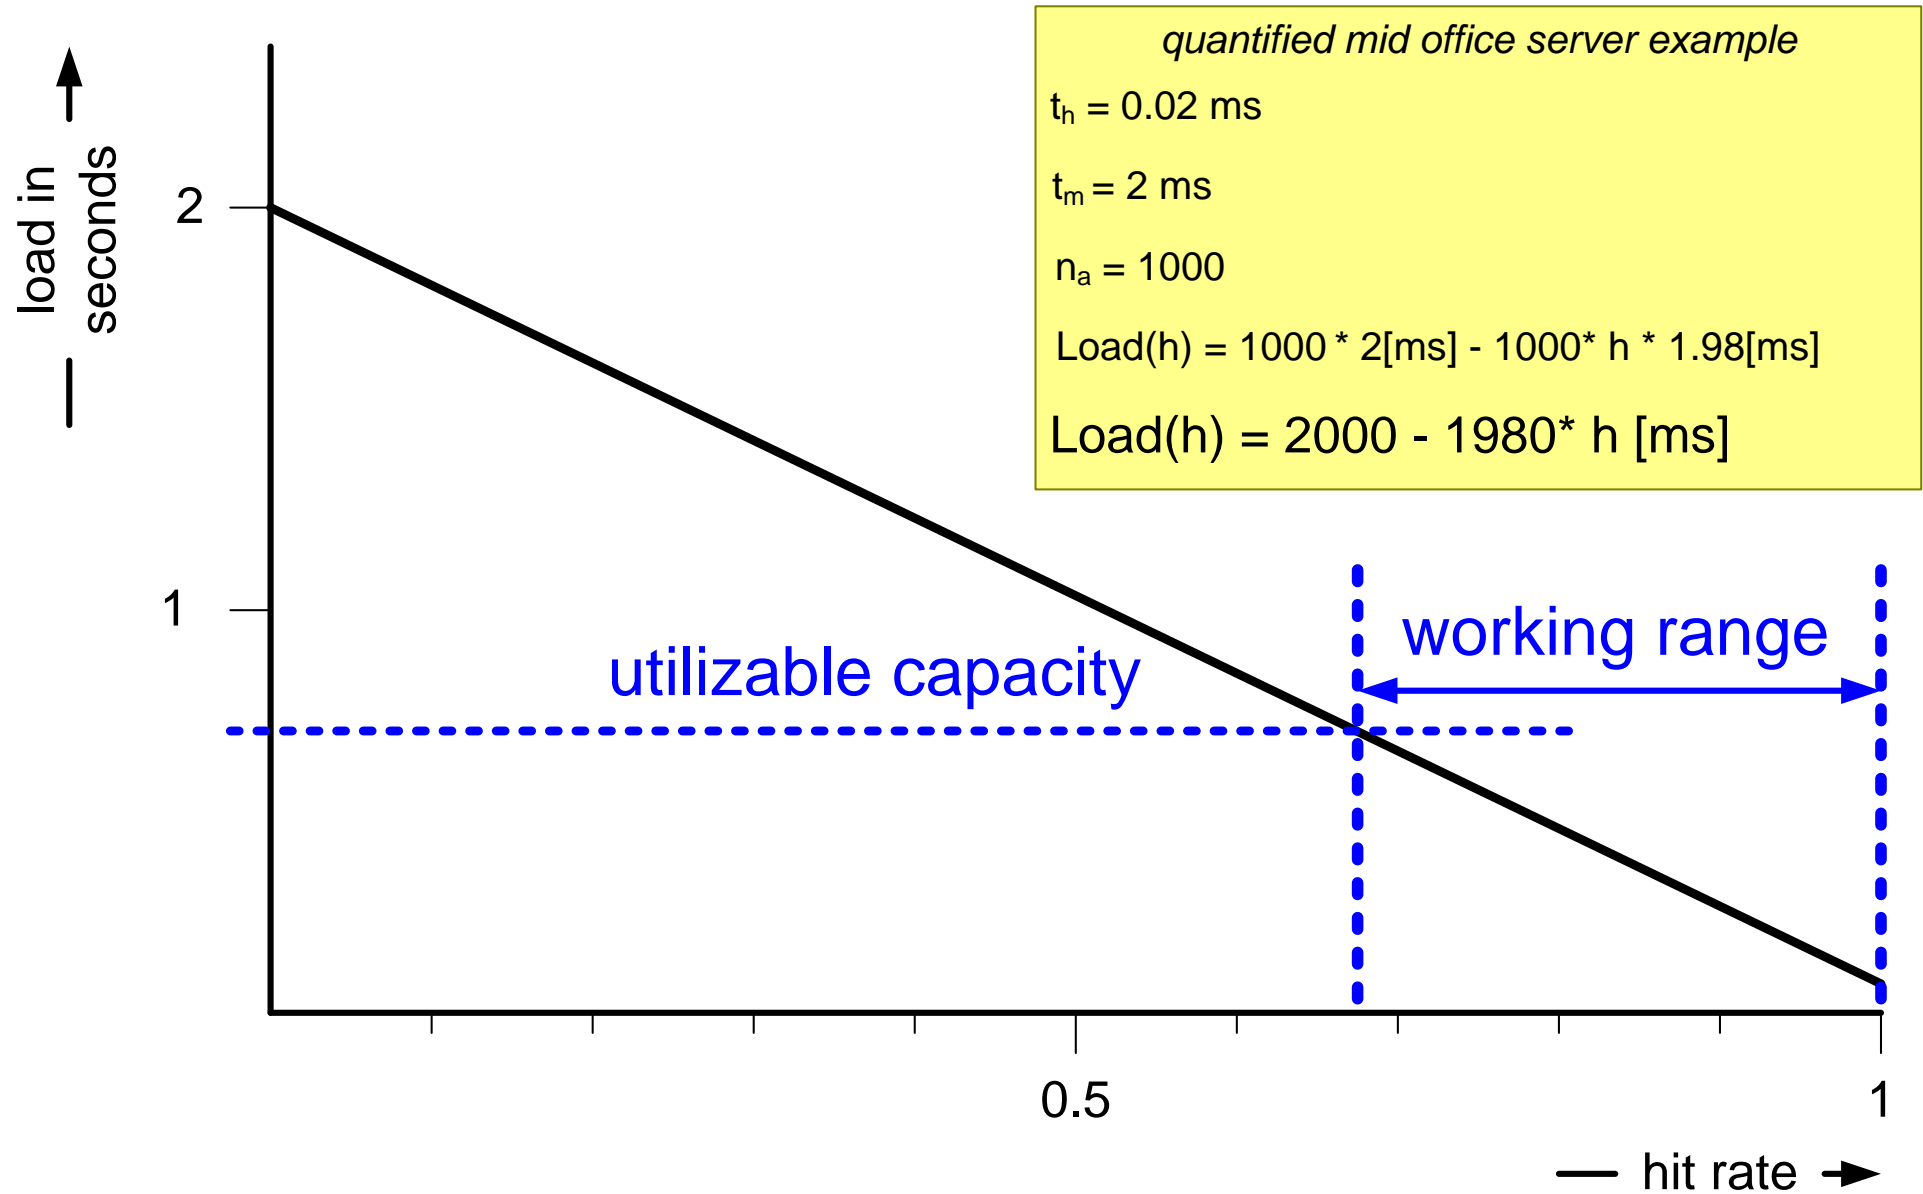

$$n_{a,m} = n_a * (1-h)$$

$n_a$  = total accesses

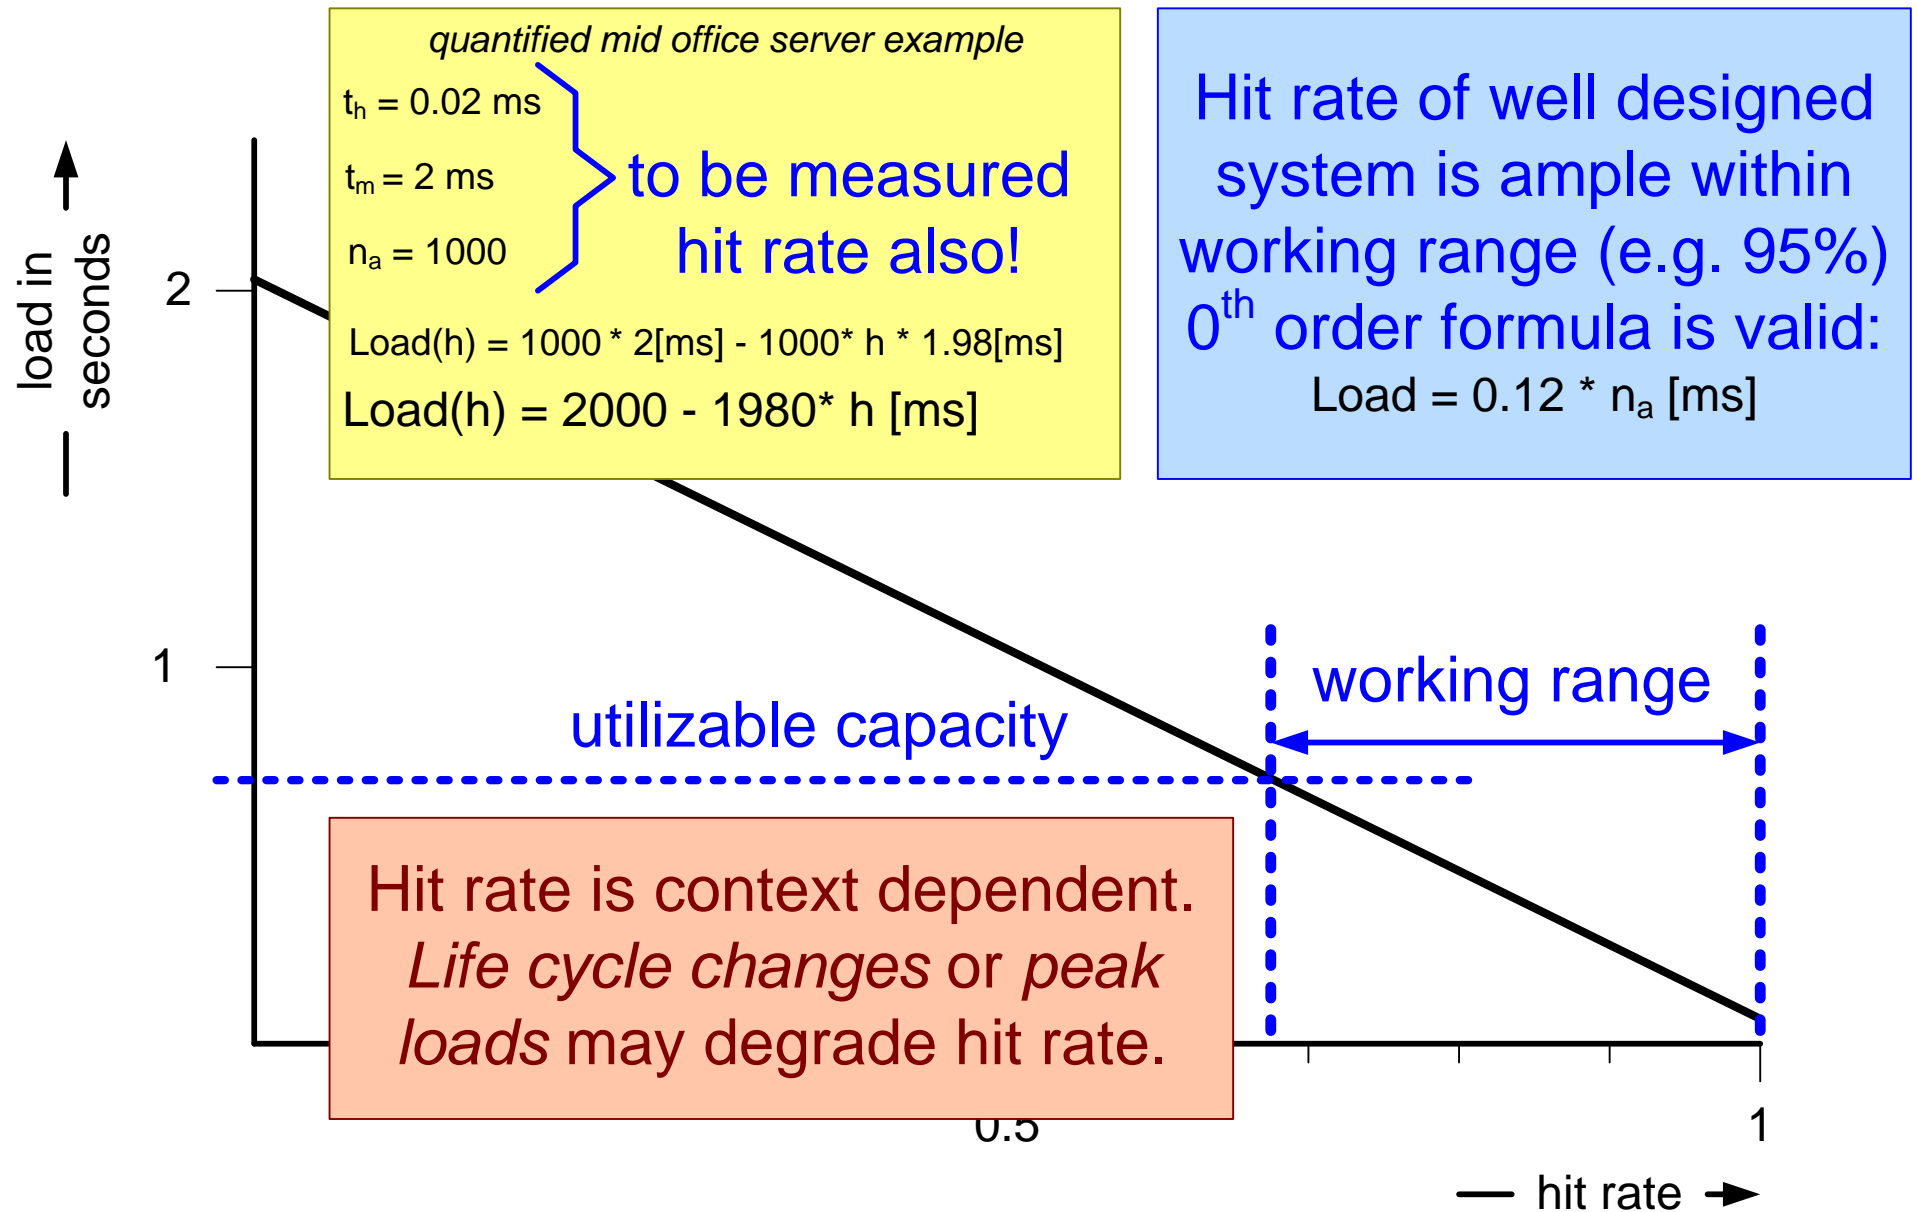

$h$  = hit rate

$$\text{Load}(h) = n_a * h * t_h + n_a * (1-h) * t_m = n_a * t_m - n_a * h * (t_m - t_h)$$

# Quantification: From Formulas to Insight

# Hit Rate Considerations

# Response Time

# What Memory Capacity is Required for Picture Transfers?

# Process View of Picture Flow in Web Server

# Formula memory Use Web Server

picture memory =

$$3 * n * s +$$

$$5 * m * s + c * s +$$

$$3 * k * s$$

where

$n$  = # data base access threads

$m$  = # picture cache threads

$k$  = # web server threads

$s$  = picture size in bytes

$c$  = in memory cache capacity in # pictures

# We Have only Modeled a Small Part of the System...

function	browse/exhibit products	sales, order intake, payments track, order handling stock handling financial bookkeeping customer relation management update catalogue advertize after sales support
----------	-------------------------	---

data	picture	structured (product attributes, logistics, ...) program code
------	---------	---

aspect	server memory use response time server load	network use reliability any resource, any NFR
--------	---	---

aspect result	=	$\sum_{d = \text{all data}}$	$\sum_{f = \text{all functions}}$	aspect(d, f)
------------------	---	------------------------------	-----------------------------------	--------------

*ignoring other dimensions such as applications, users, circumstances*

static

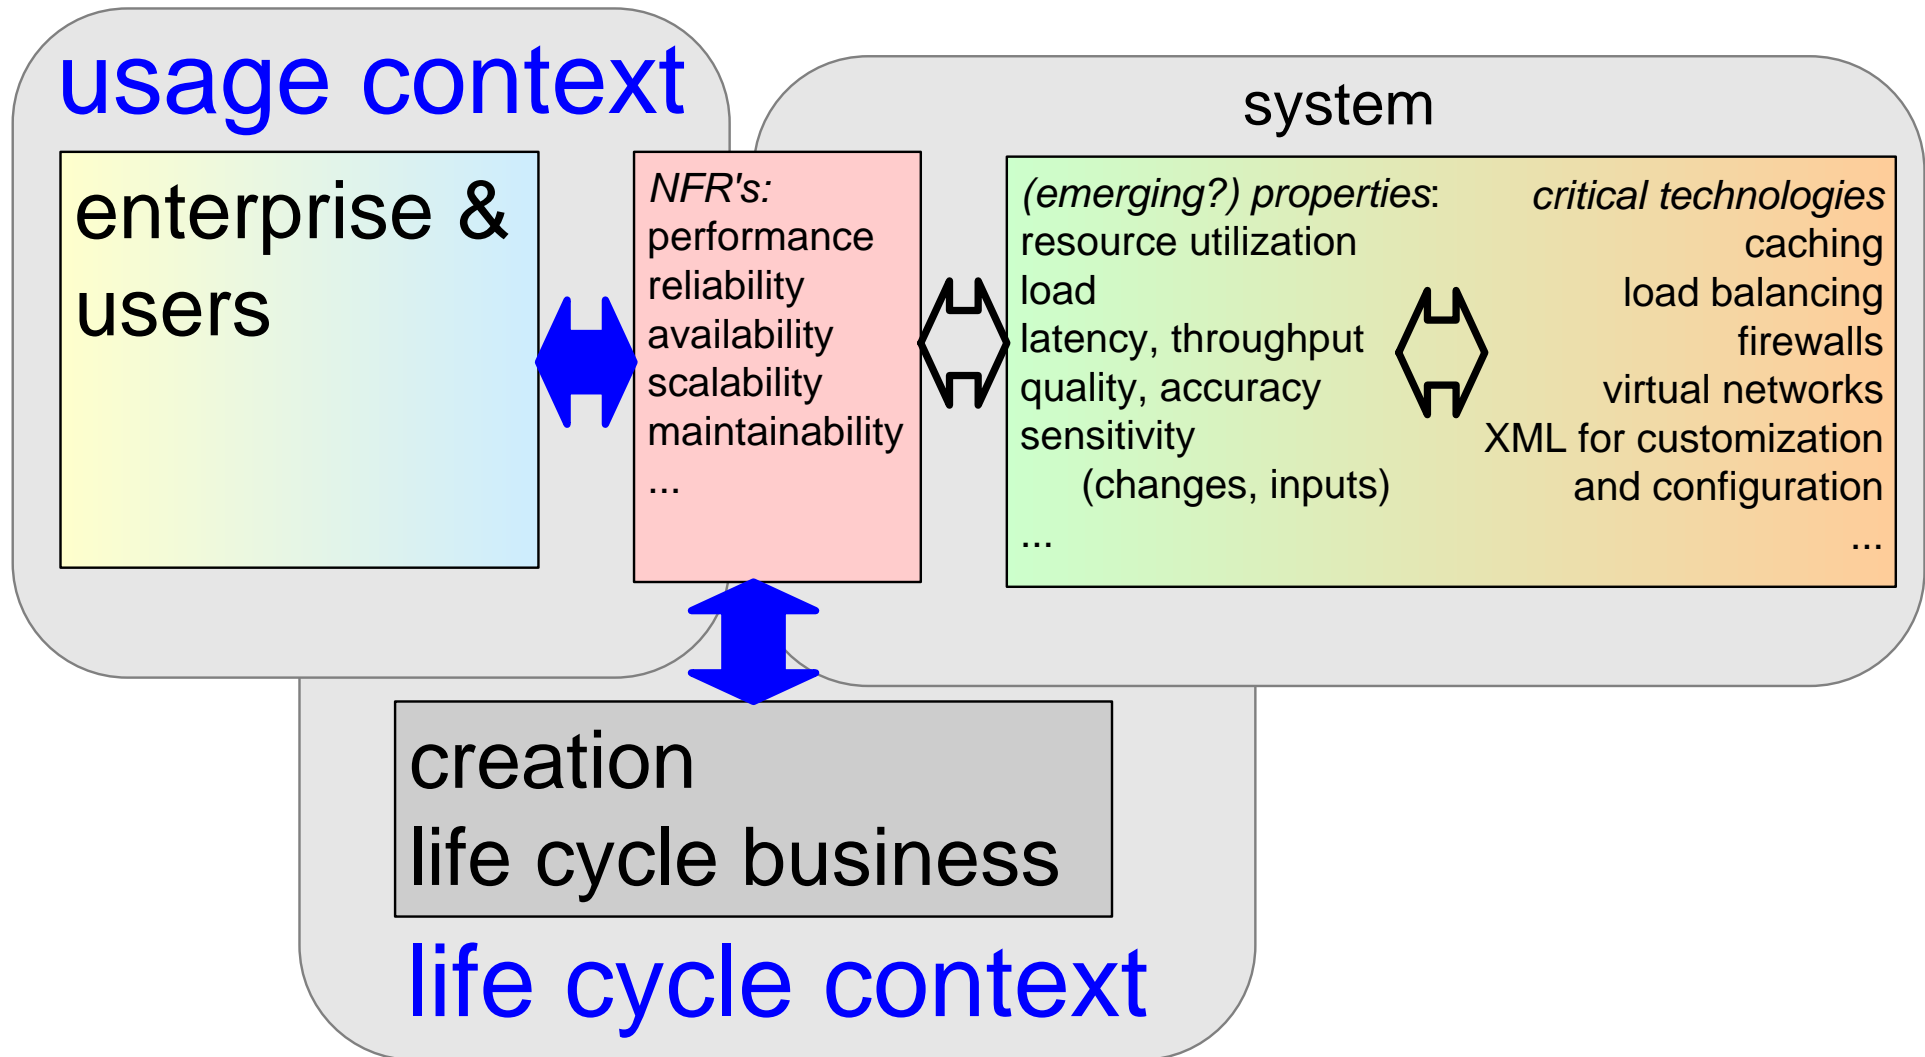

mostly assumptions and coarse estimates

some insight in:

what are key design issues

what are relevant use case areas

# Refinement After Context Modeling

## *Conclusions*

Non Functional Requirements are the starting point for system modeling  
Focus on highest ranking relations between NFR's and critical technologies  
Make simple mathematical models  
Evaluate quantified instantiations

## *Techniques, Models, Heuristics of this module*

Non functional requirements  
System properties  
Critical technologies  
Graph of relations
