Abstract

Software has a number of characteristics, which impact systems integration.

Distribution

This article or presentation is written as part of the Gaudí project. The Gaudí project philosophy is to improve by obtaining frequent feedback. Frequent feedback is pursued by an open creation process. This document is published as intermediate or nearly mature version to get feedback. Further distribution is allowed as long as the document remains complete and unchanged.

TBD

When SW engineers demand "requirements",
then they expect *frozen* inputs
to be used for
the design, implementation and validation
of the software

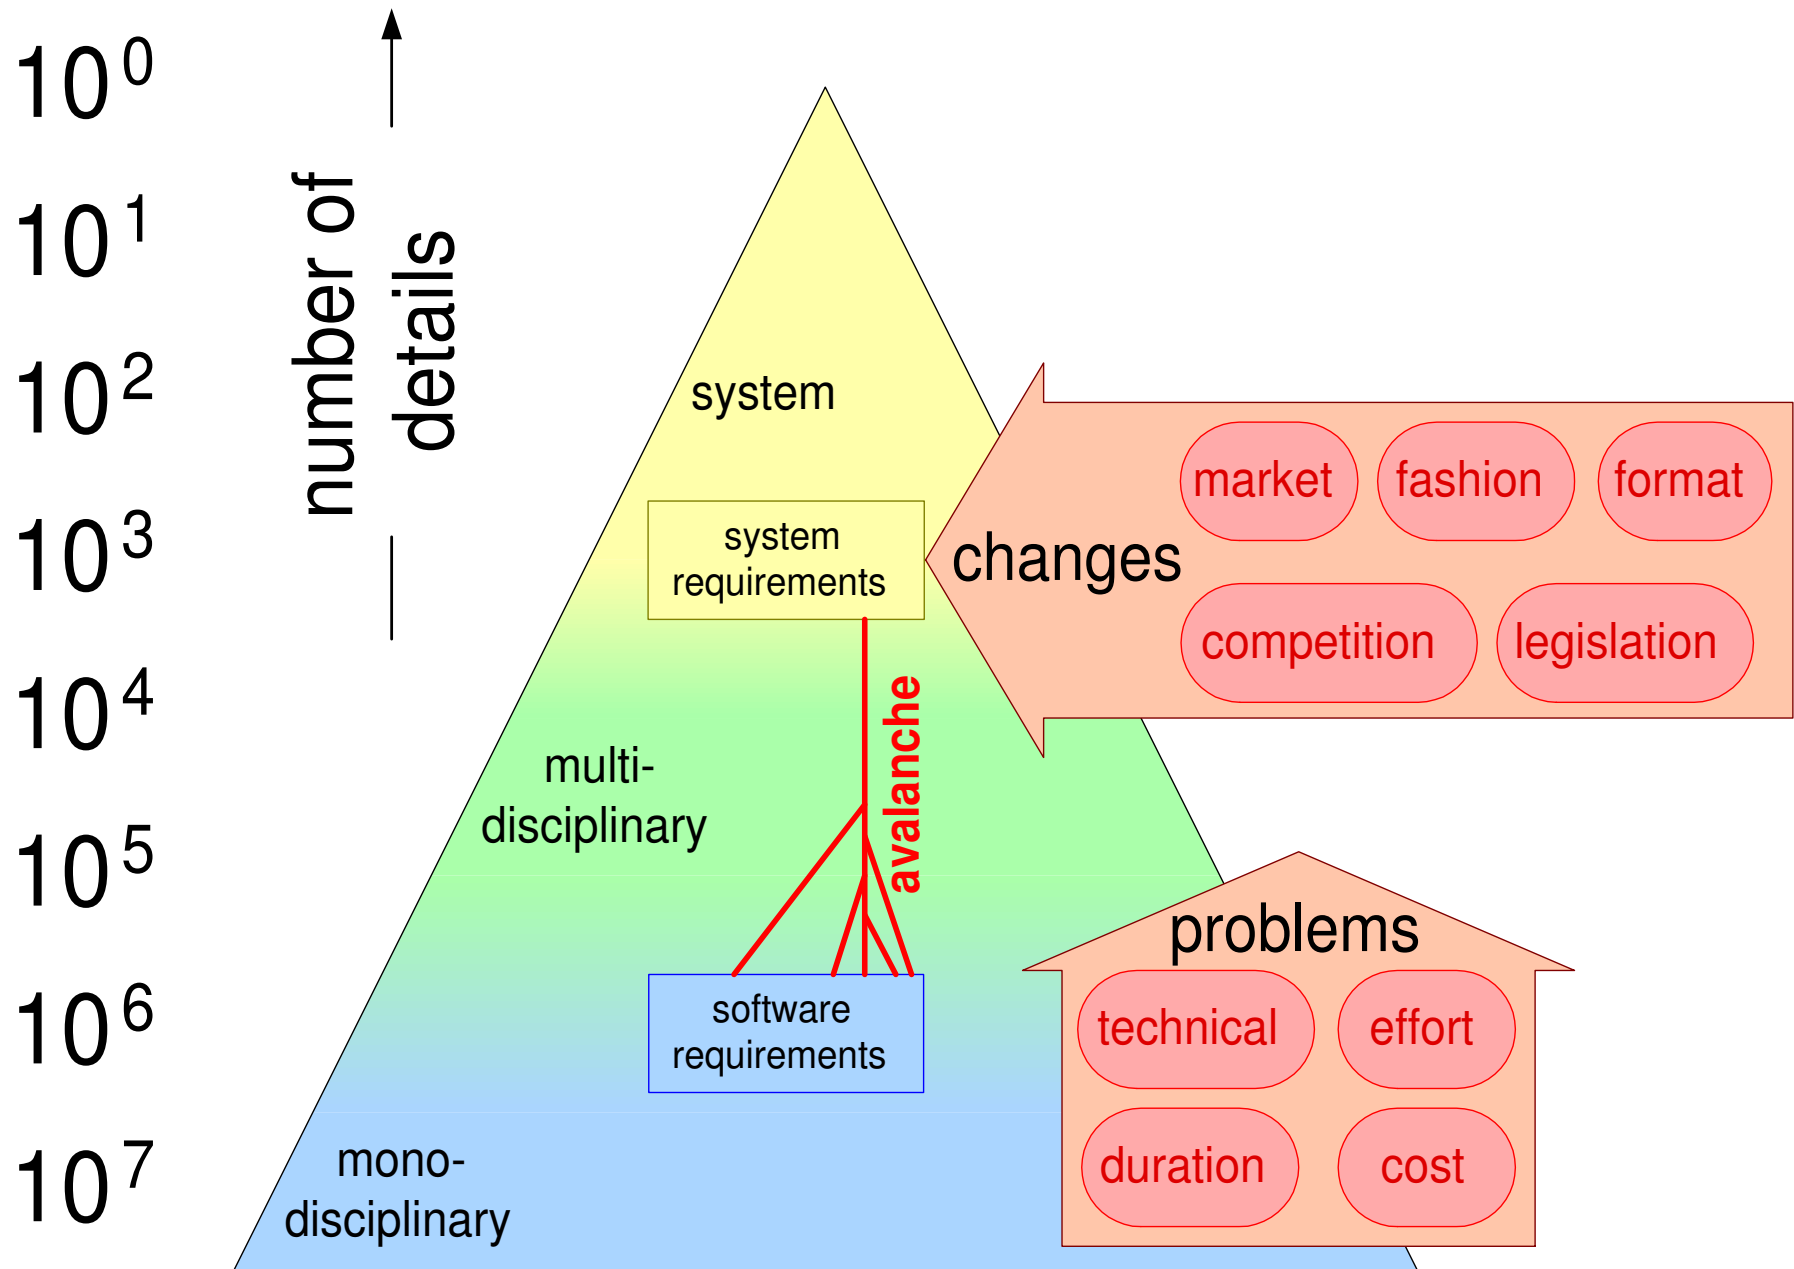

System vs Software Requirements

Why is the Software Requirement Specification so Large?

And why is it never up-to-date?

Different Focus of Software and System

System engineering focus

qualities
productivity
image quality
reliability

→ *concepts*
domain requirements
models

concerns
integral design (quality, balance)
system context
lifecycle
operational processes

education
principles
heuristics
analysis and synthesis
processes

SW engineering focus

qualities
functionality
maintainability
variability

→ *concepts*
structure
(generic) mechanisms

concerns
configuration management
release procedure
tools
SW processes
SW problems, change requests

education
languages
operating systems
algorithms
formal methods

Caricature of a SW Architecture

Caricature of Physics Systems View

Relation SW and Physics

Symptoms of too isolated SW efforts

symptoms

SW people are clustered together

SW is alpha tested before system integration

SW team uses own specification and design process

SW specification is in SW jargon or formalism

counter measures

colocation per function, subsystem or quality

continuous system integration

higher level processes are shared

interaction between SW,
HW and system engineers

Hardware Software System
