

Why Quantified Insight in System Design is Required.

by *Gerrit Muller* Buskerud University College

e-mail: gaudisite@gmail.com

Abstract

Software education is mostly function-oriented. Techniques and formalisms are focused on system *behavior*. Software architects often don't have a quantified insight in problem domain or chosen solutions, although computers work internally with bits and bytes. This is a problem for IT systems in general, but is more so for embedded systems. Embedded systems interact with the physical world, which can be modeled quantitatively: energy consumption, speed, force, et cetera. This presentation addresses quantification of system and software design, illustrated by case examples.

Distribution

This article or presentation is written as part of the Gaudí project. The Gaudí project philosophy is to improve by obtaining frequent feedback. Frequent feedback is pursued by an open creation process. This document is published as intermediate or nearly mature version to get feedback. Further distribution is allowed as long as the document remains complete and unchanged.

Purpose of Quantification

Ask a SW-architect to *quantify*
the product under construction.

What happens?

?

Ask a SW-architect to *quantify*
the product under construction.

What happens?

The *project* is quantified, rather than
the *system* of interest

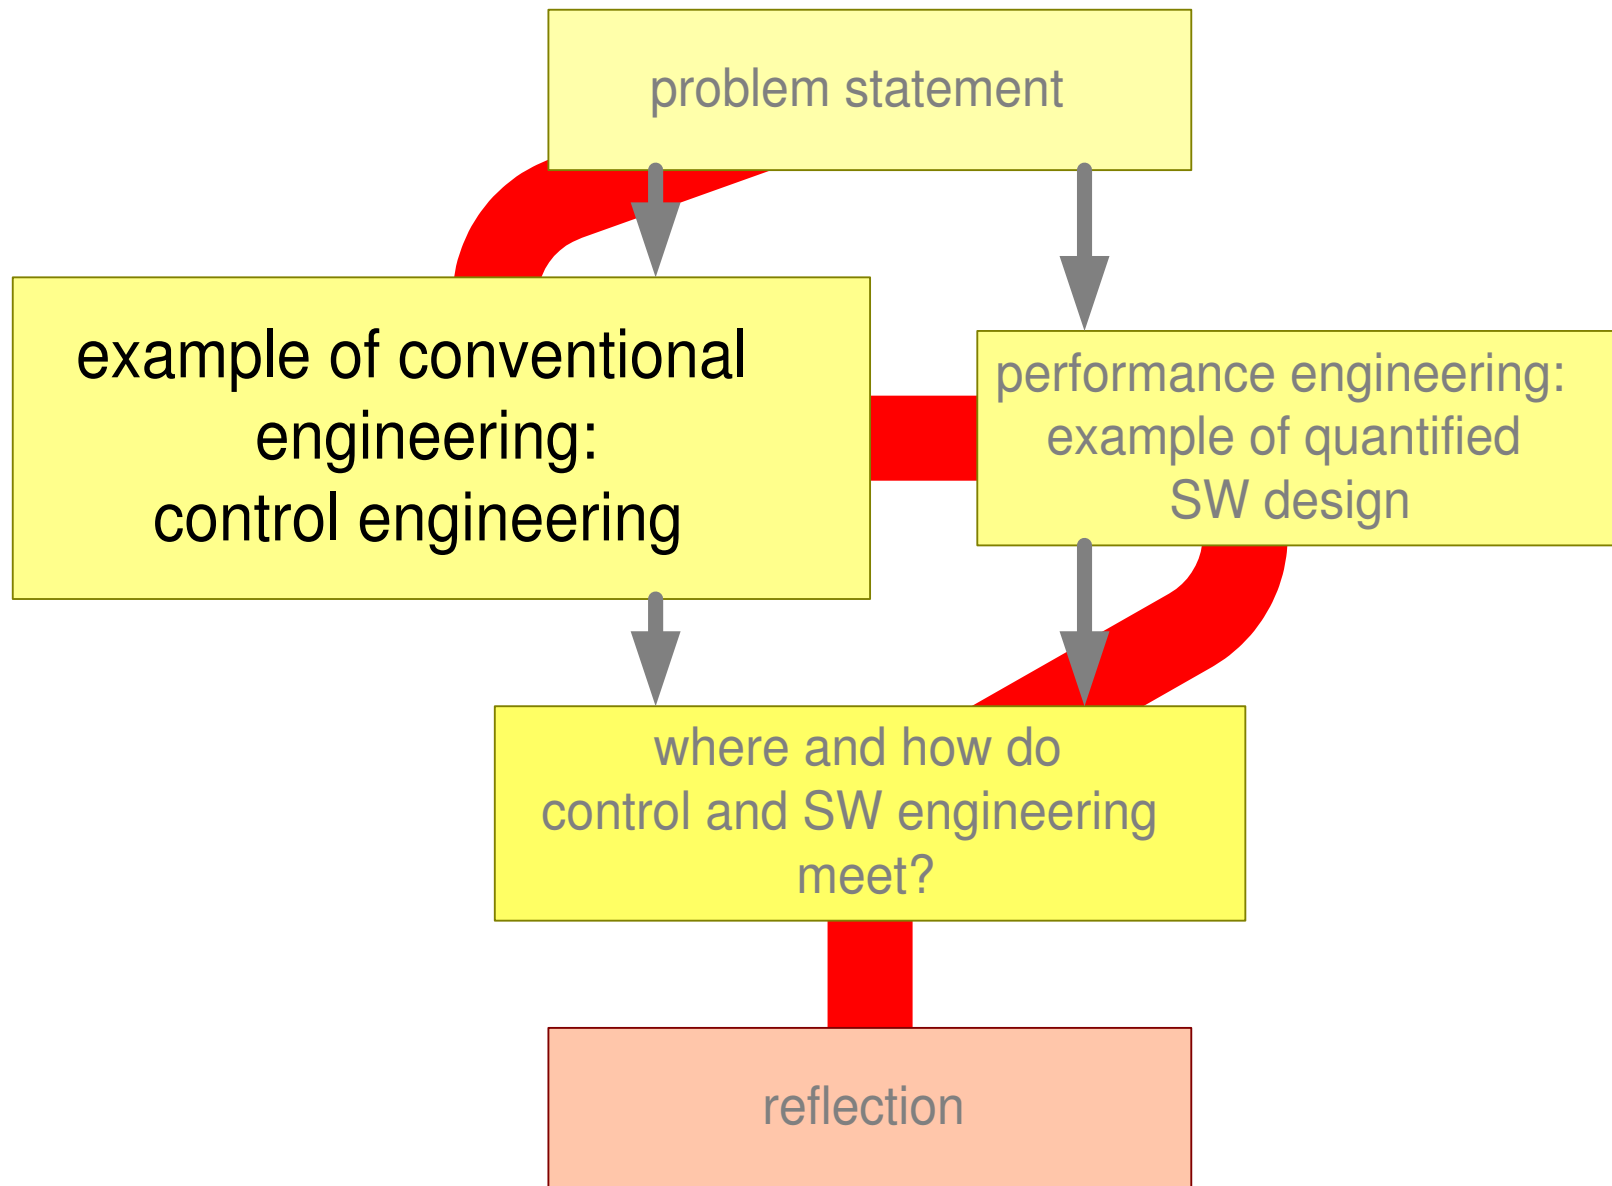

<i>man-years</i>	<i>code-complexity</i>
<i>lines-of-code</i>	<i>fault density</i>
<i>problem reports</i>	<i>release schedule</i>

The SW engineering discipline today is *process* oriented, quantities are process metrics.

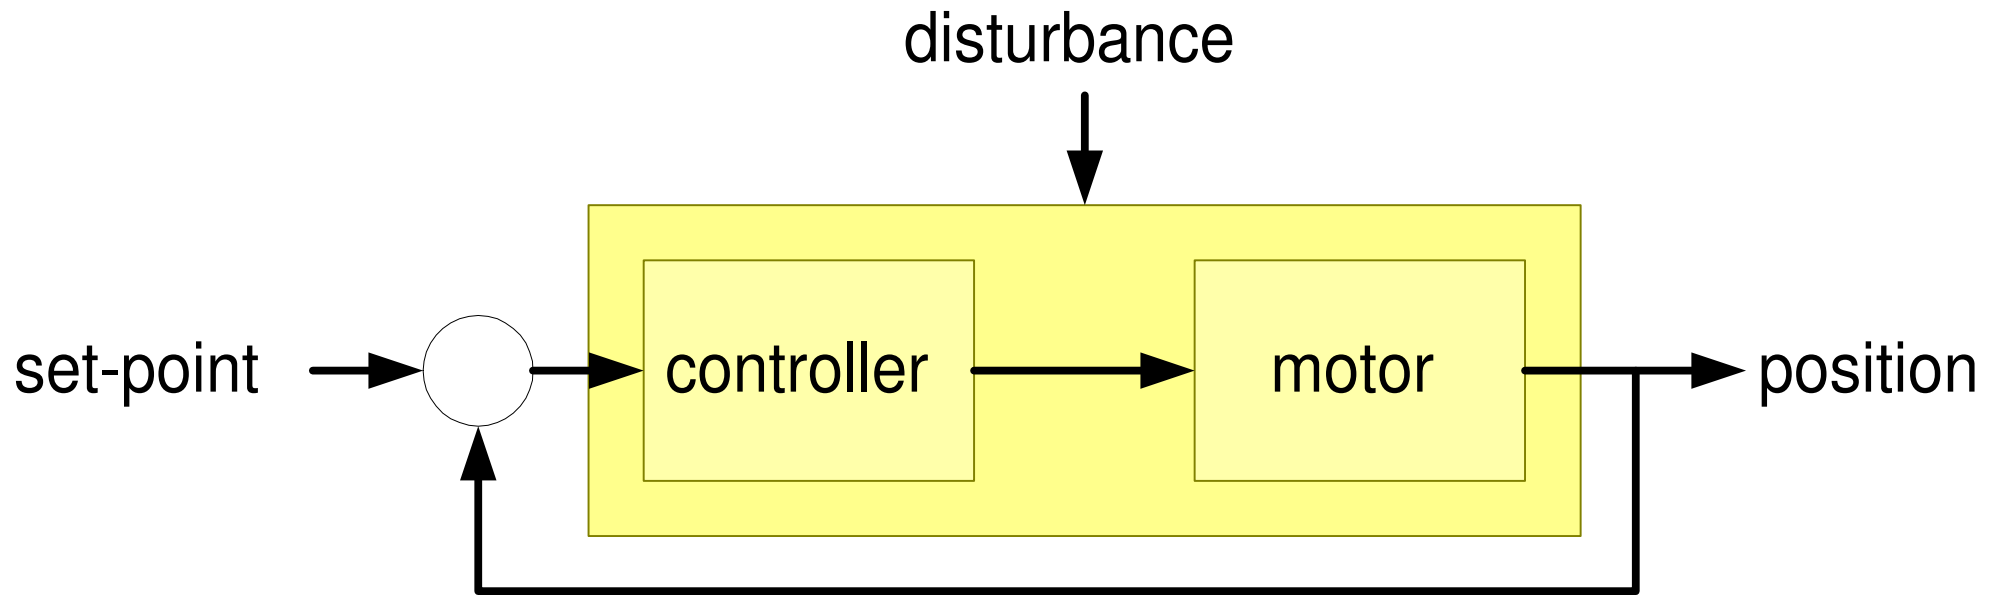

The System Of Interest (SOI) is designed from *behavioral* point of view.

Conventional Engineering disciplines design the SOI with *quantitative* techniques.

Qualities of SW intensive systems, such as performance, are *emerging* i.s.o. *predictable* properties

Block Diagram Control Measurement

Measuring Disturbance Transfer

Idealized Disturbance Transfer

Measuring Tracking Response

Idealized Tracking Response

Black Box Model

↕
parameters
bandwidth
overshoot
order
...

black box :
simplified model
mathematical formula
with physical interpretation:
 $\text{response} = f(\text{stimulus}, \text{parameters})$

White Box Model

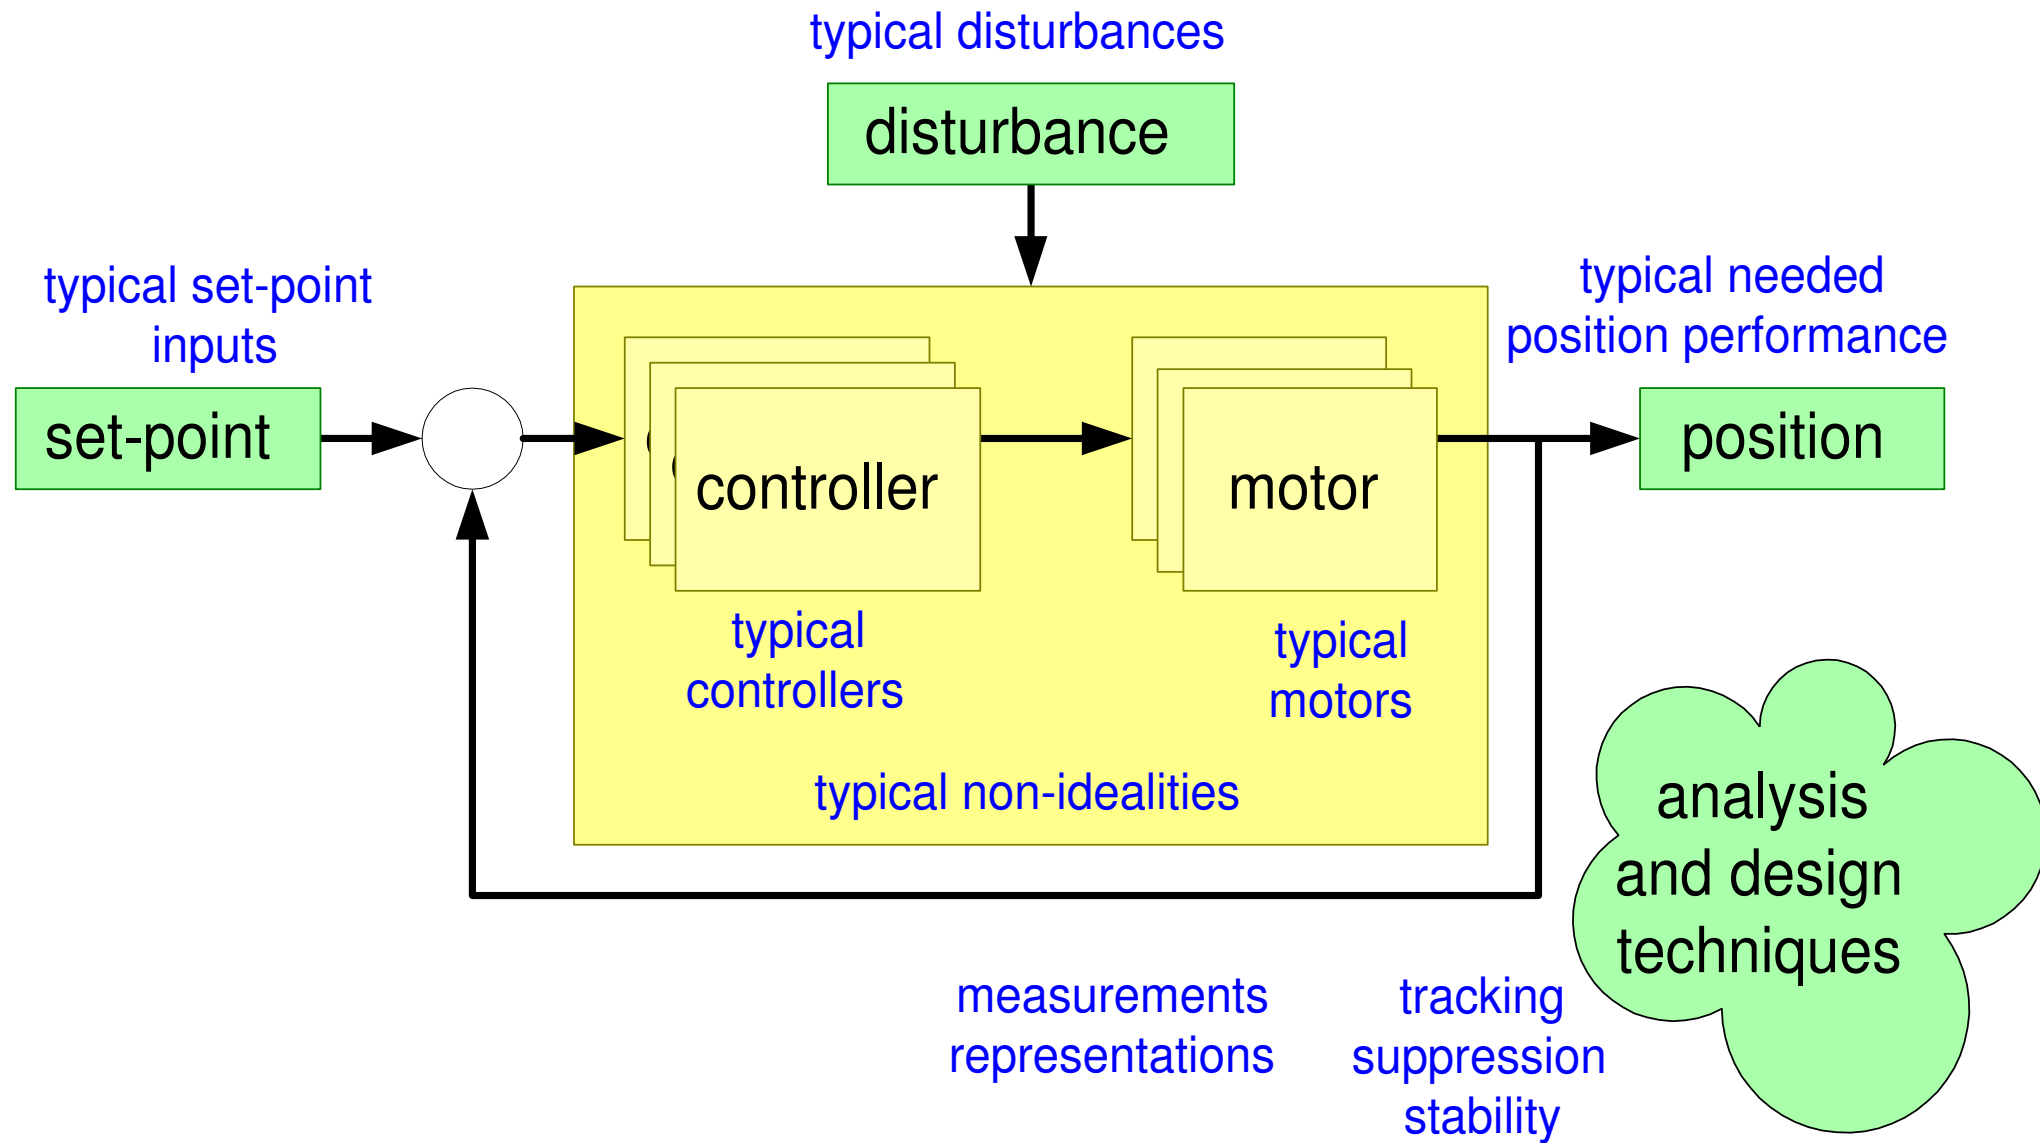

↕
parameters
bandwidth
overshoot
order
...

white box :

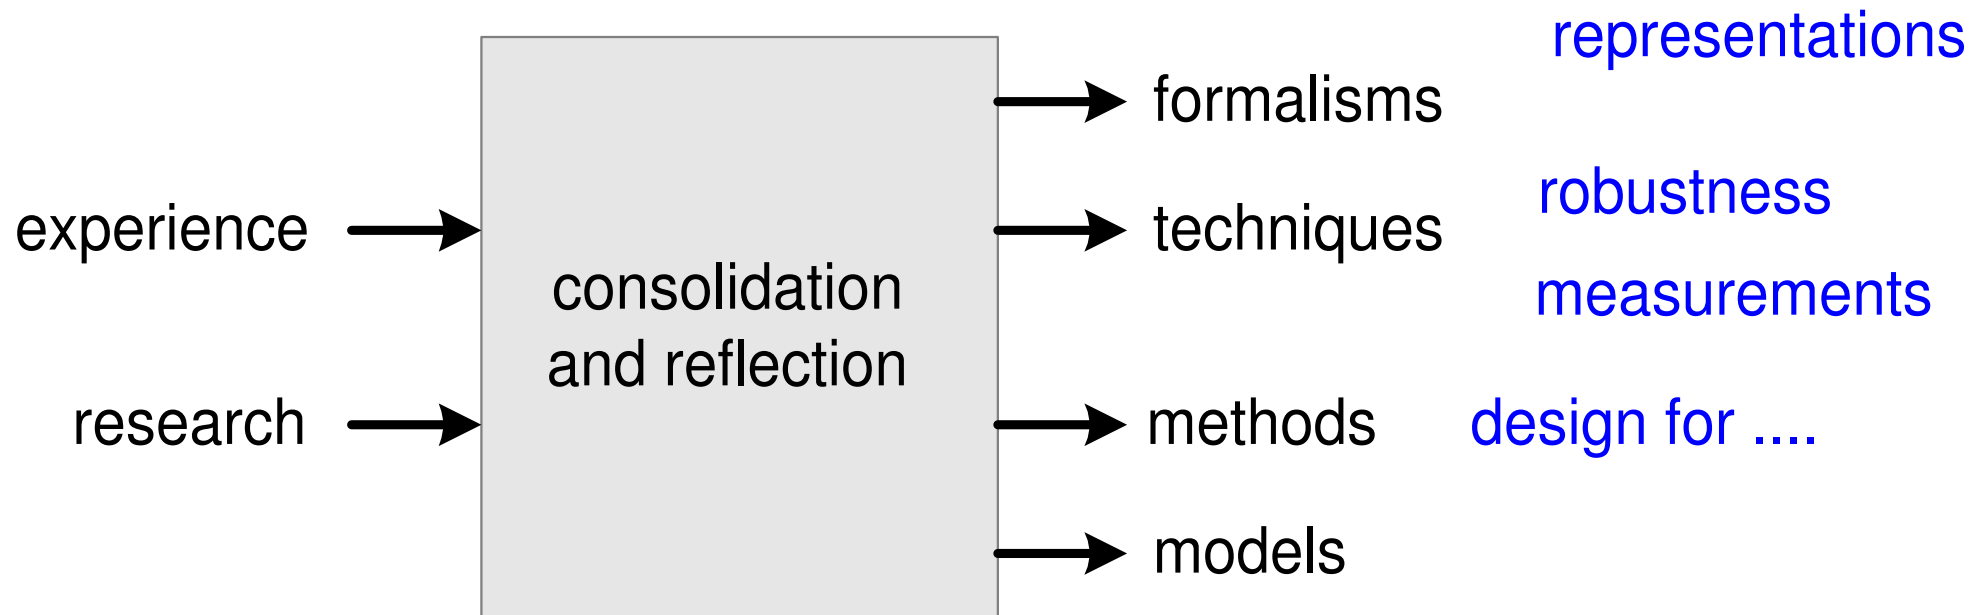

black box model plus
experience based reasoning
over non-idealities
 $\text{response} = f(\text{stimulus}, \text{parameters}, \text{some parametrized non-idealities})$

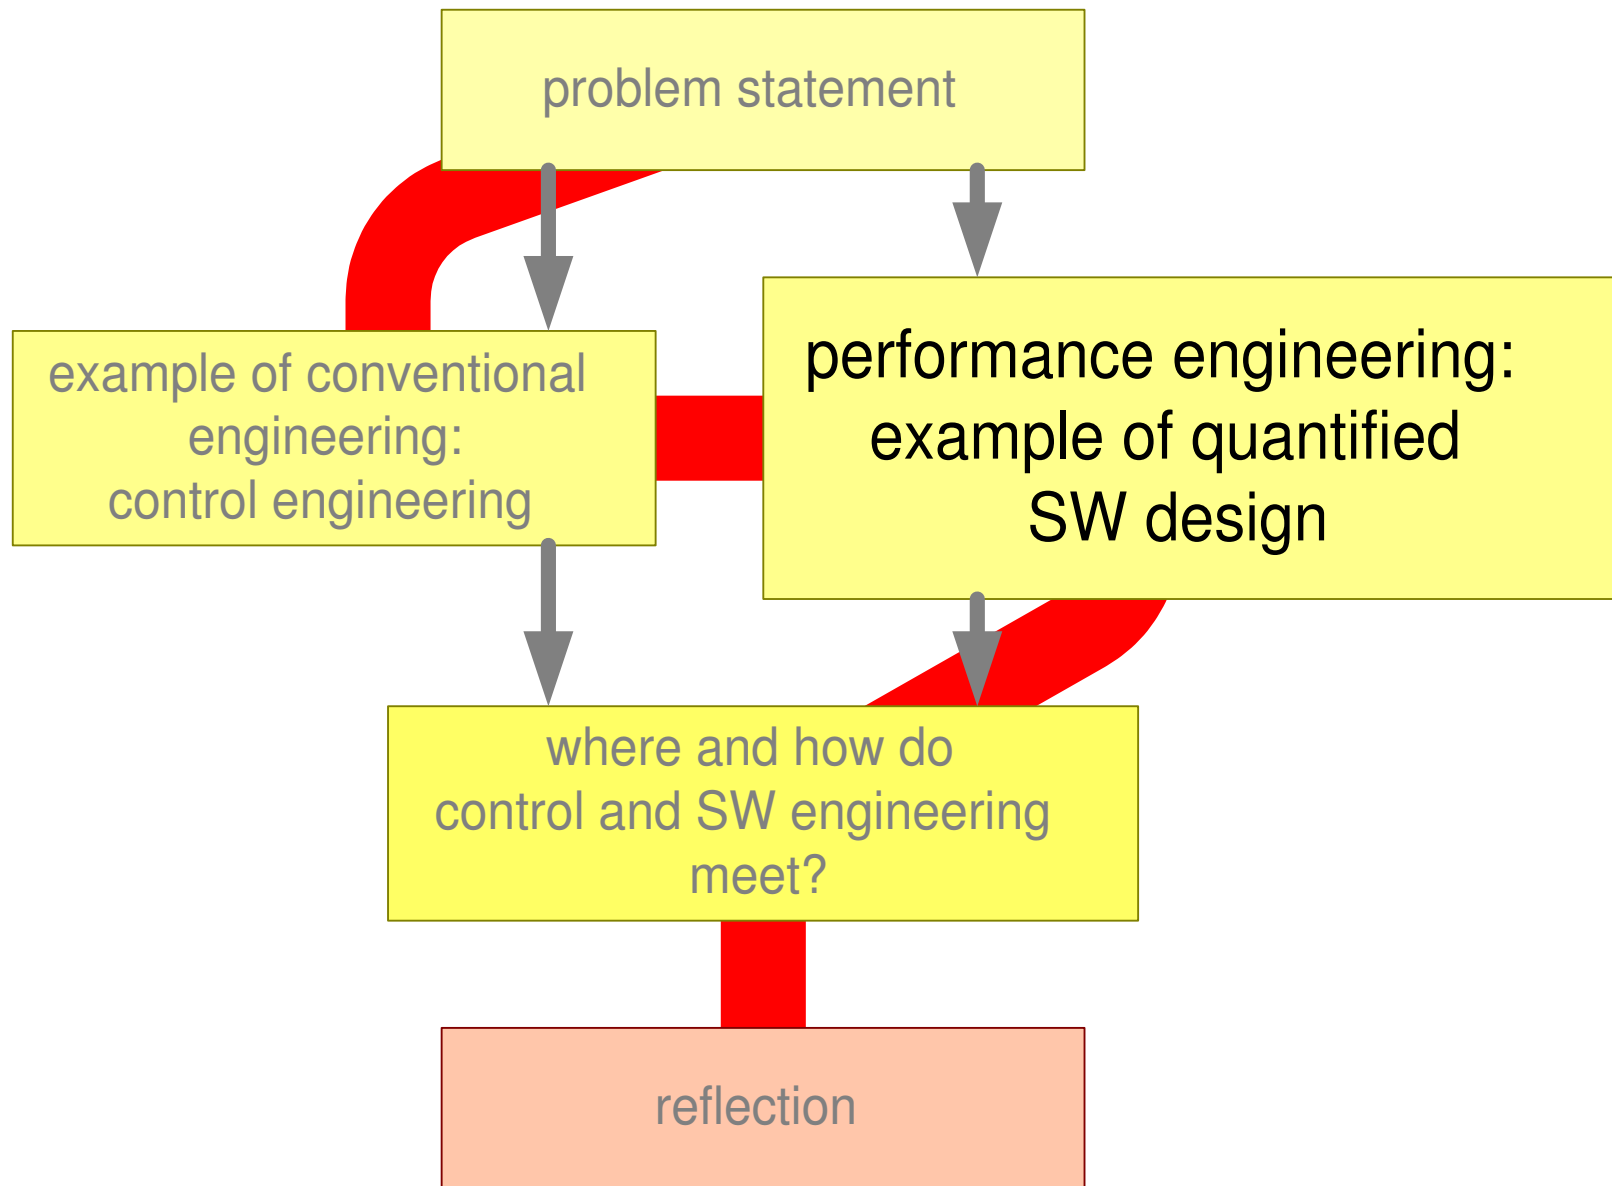

challenge: to know what non-idealities to ignore
and to ignore as much as possible

Control Engineering Knowledge

Summary of Control Engineering

What is the Performance of this Code?

application need:

at event 3*3 show 3*3 images
instantaneous

design

design

Sample application code:

```
for x = 1 to 3 {  
  for y = 1 to 3 {  
    retrieve_image(x,y)  
  }  
}
```

or

alternative application code:

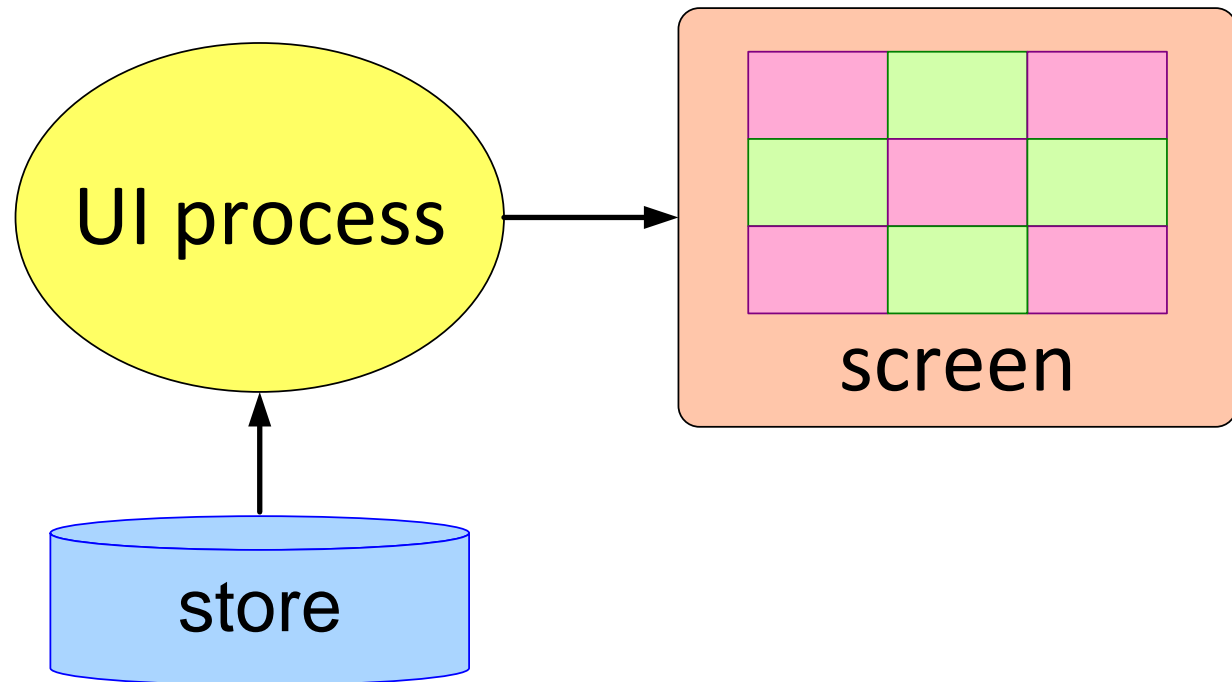

event 3*3 -> show screen 3*3

```
<screen 3*3>  
  <row 1>  
    <col 1><image 1,1></col 1>  
    <col 2><image 1,2></col 2>  
    <col 3><image 1,3></col 3>  
  </row 1>  
  <row 2>  
    <col 1><image 1,1></col 1>  
    <col 2><image 1,2></col 2>  
    <col 3><image 1,3></col 3>  
  </row 1>  
  <row 2>  
    <col 1><image 1,1></col 1>  
    <col 2><image 1,2></col 2>  
    <col 3><image 1,3></col 3>  
  </row 3>  
</screen 3*3>
```

What If....

Sample application code:

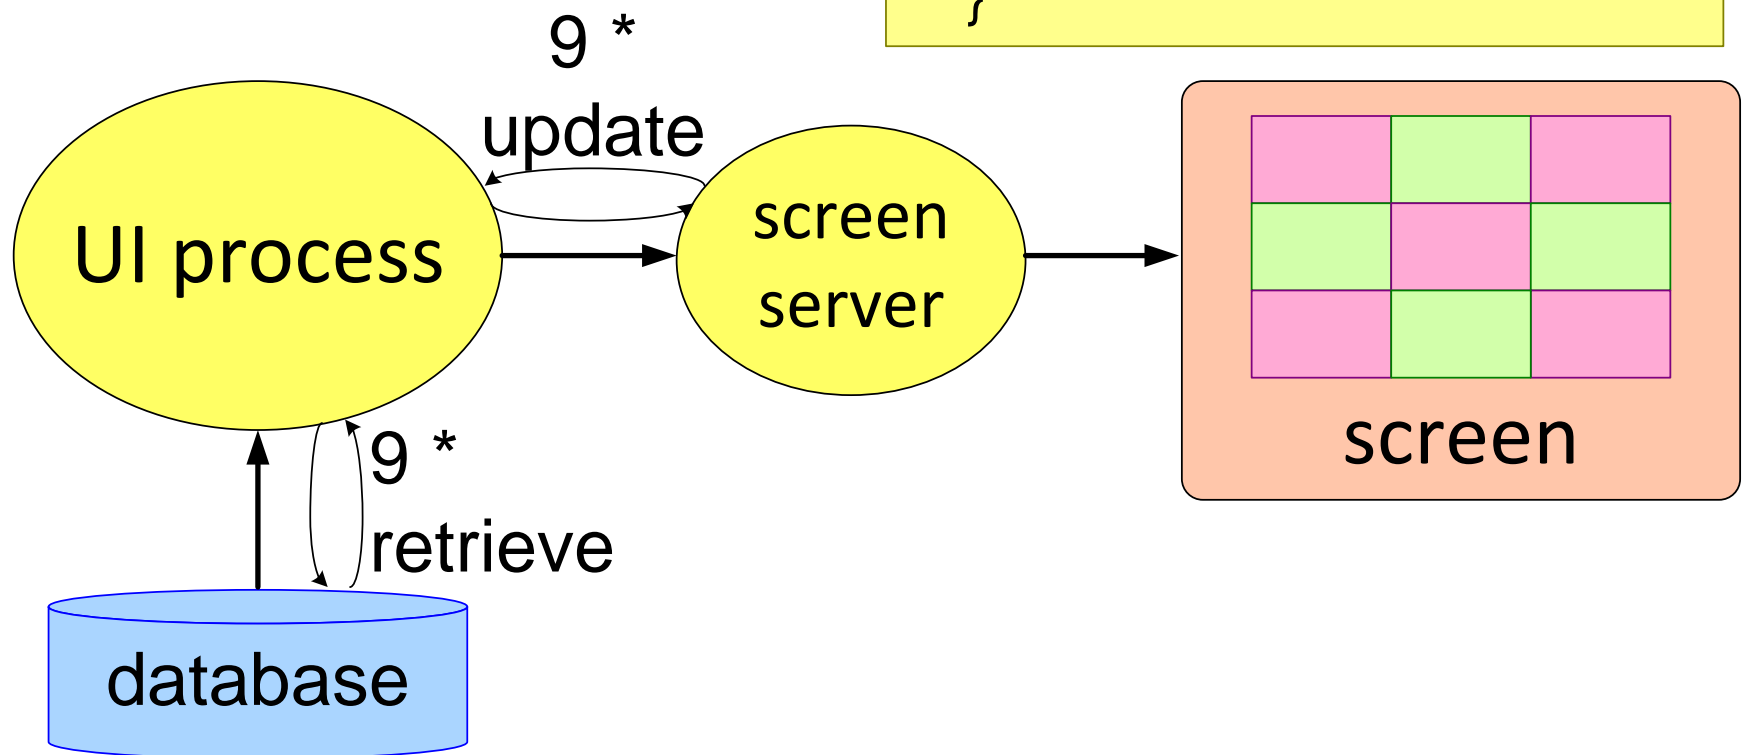

```
for x = 1 to 3 {  
  for y = 1 to 3 {  
    retrieve_image(x,y)  
  }  
}
```

What If....

Sample application code:

```
for x = 1 to 3 {  
  for y = 1 to 3 {  
    retrieve_image(x,y)  
  }  
}
```

What If....

```
Sample application code:  
  
for x = 1 to 3 {  
  for y = 1 to 3 {  
    retrieve_image(x,y)  
  }  
}
```

Attribute = 1 COM object
100 attributes / image
9 images = 900 COM objects
1 COM object = 80µs
9 images = 72 ms

What If....

Sample application code:

```
for x = 1 to 3 {  
  for y = 1 to 3 {  
    retrieve_image(x,y)  
  }  
}
```

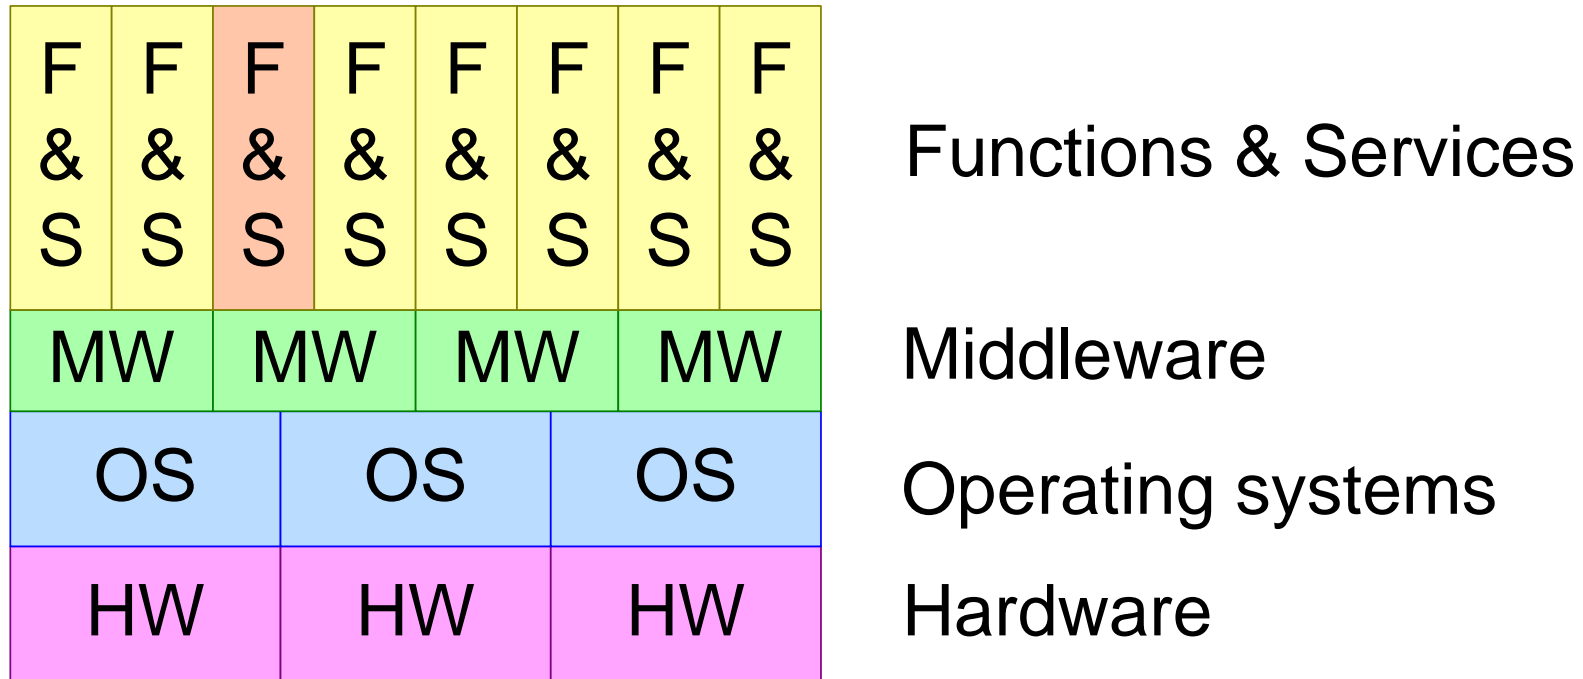

- I/O on line basis (512^2 image)

$$9 * 512 * t_{I/O}$$

$$t_{I/O} \approx 1ms$$

- . . .

Challenge SW Performance Design

Performance = Function (F&S, other F&S, MW, OS, HW)
MW, OS, HW >> 100 Manyear : very complex

Challenge: How to understand MW, OS, HW
with only a few parameters

Layered Benchmarking

Case: ARM9 Cache Performance

Example Hardware Performance

ARM9 200 MHz $t_{\text{context switch}}$ as function of cache use

cache setting	$t_{\text{context switch}}$
From cache	2 μs
After cache flush	10 μs
Cache disabled	50 μs

Context Switch Overhead

$$t_{\text{overhead}} = n_{\text{context switch}} * t_{\text{context switch}}$$

$n_{\text{context switch}}$ (s^{-1})	$t_{\text{context switch}} = 10\mu s$		$t_{\text{context switch}} = 2\mu s$	
	t_{overhead}	CPU load overhead	t_{overhead}	CPU load overhead
500	5ms	0.5%	1ms	0.1%
5000	50ms	5%	10ms	1%
50000	500ms	50%	100ms	10%

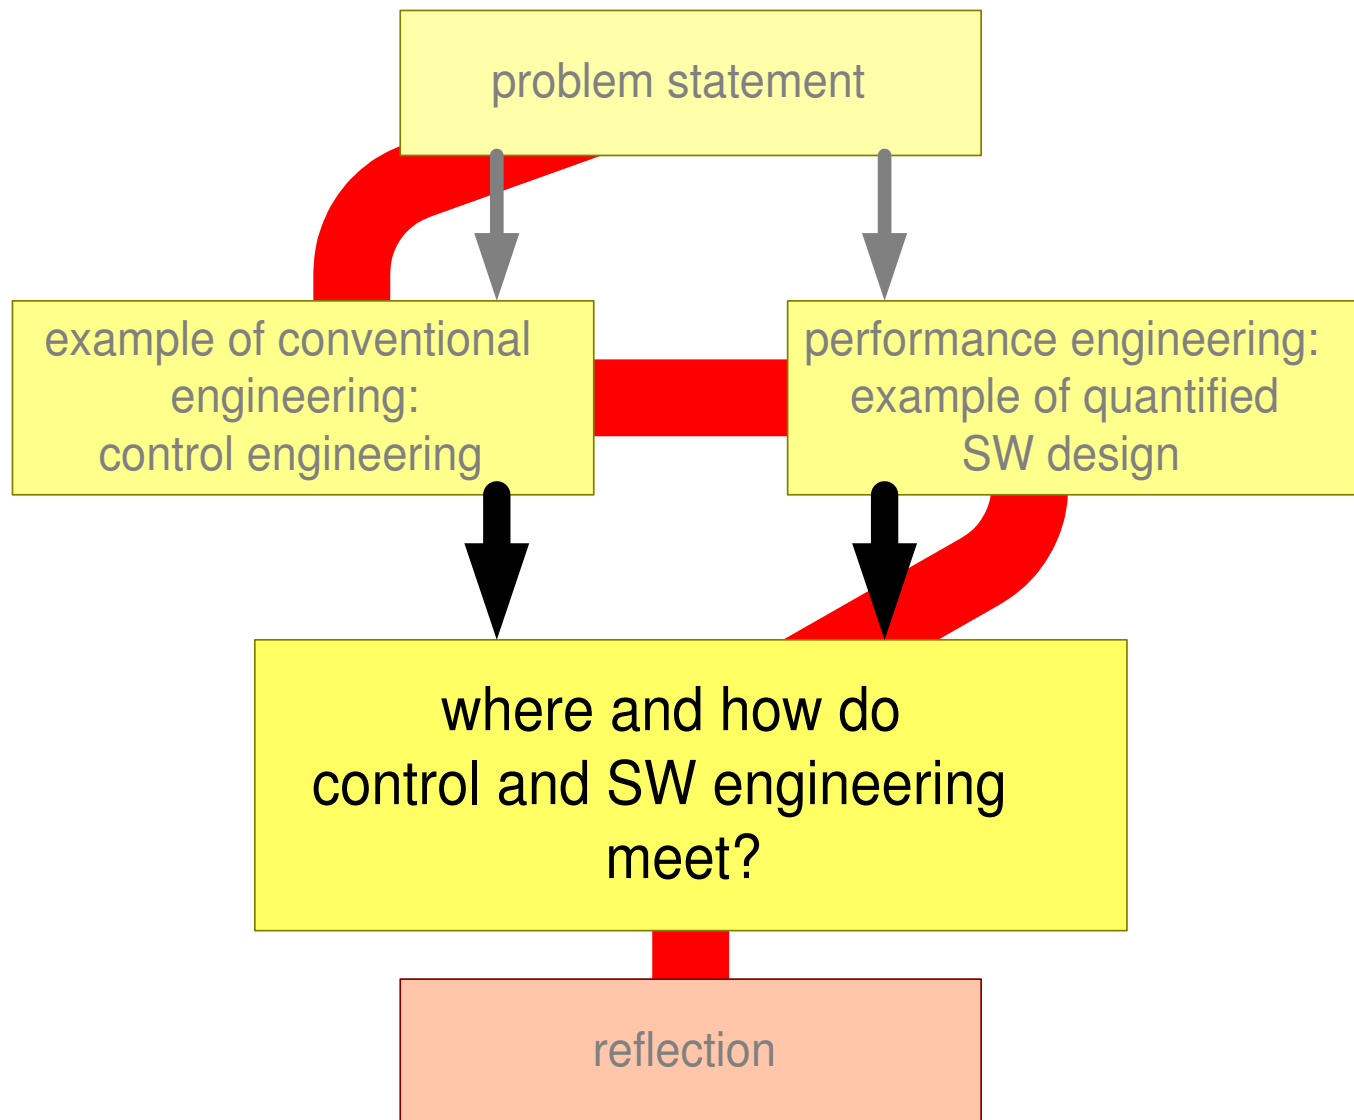

Performance as Function of all Layers

system performance = f(

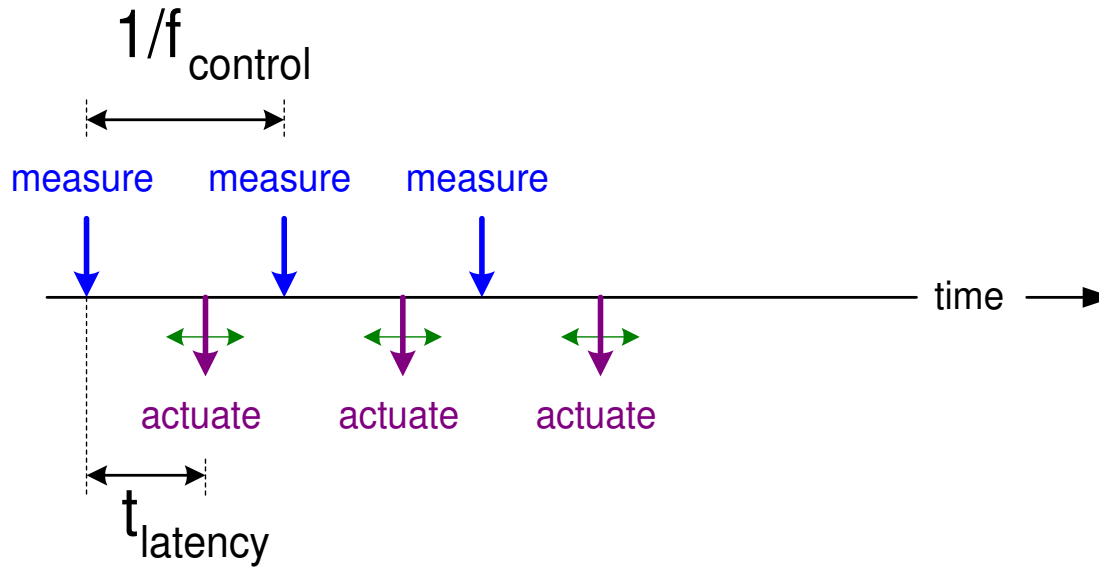

↑
how much
does it cost?

↓
what is used?
how often?

Impact of Timing on Control Performance

0^e order

Performance_{control} =

$$f \left(f_{\text{control}}, t_{\text{latency}} \right)$$

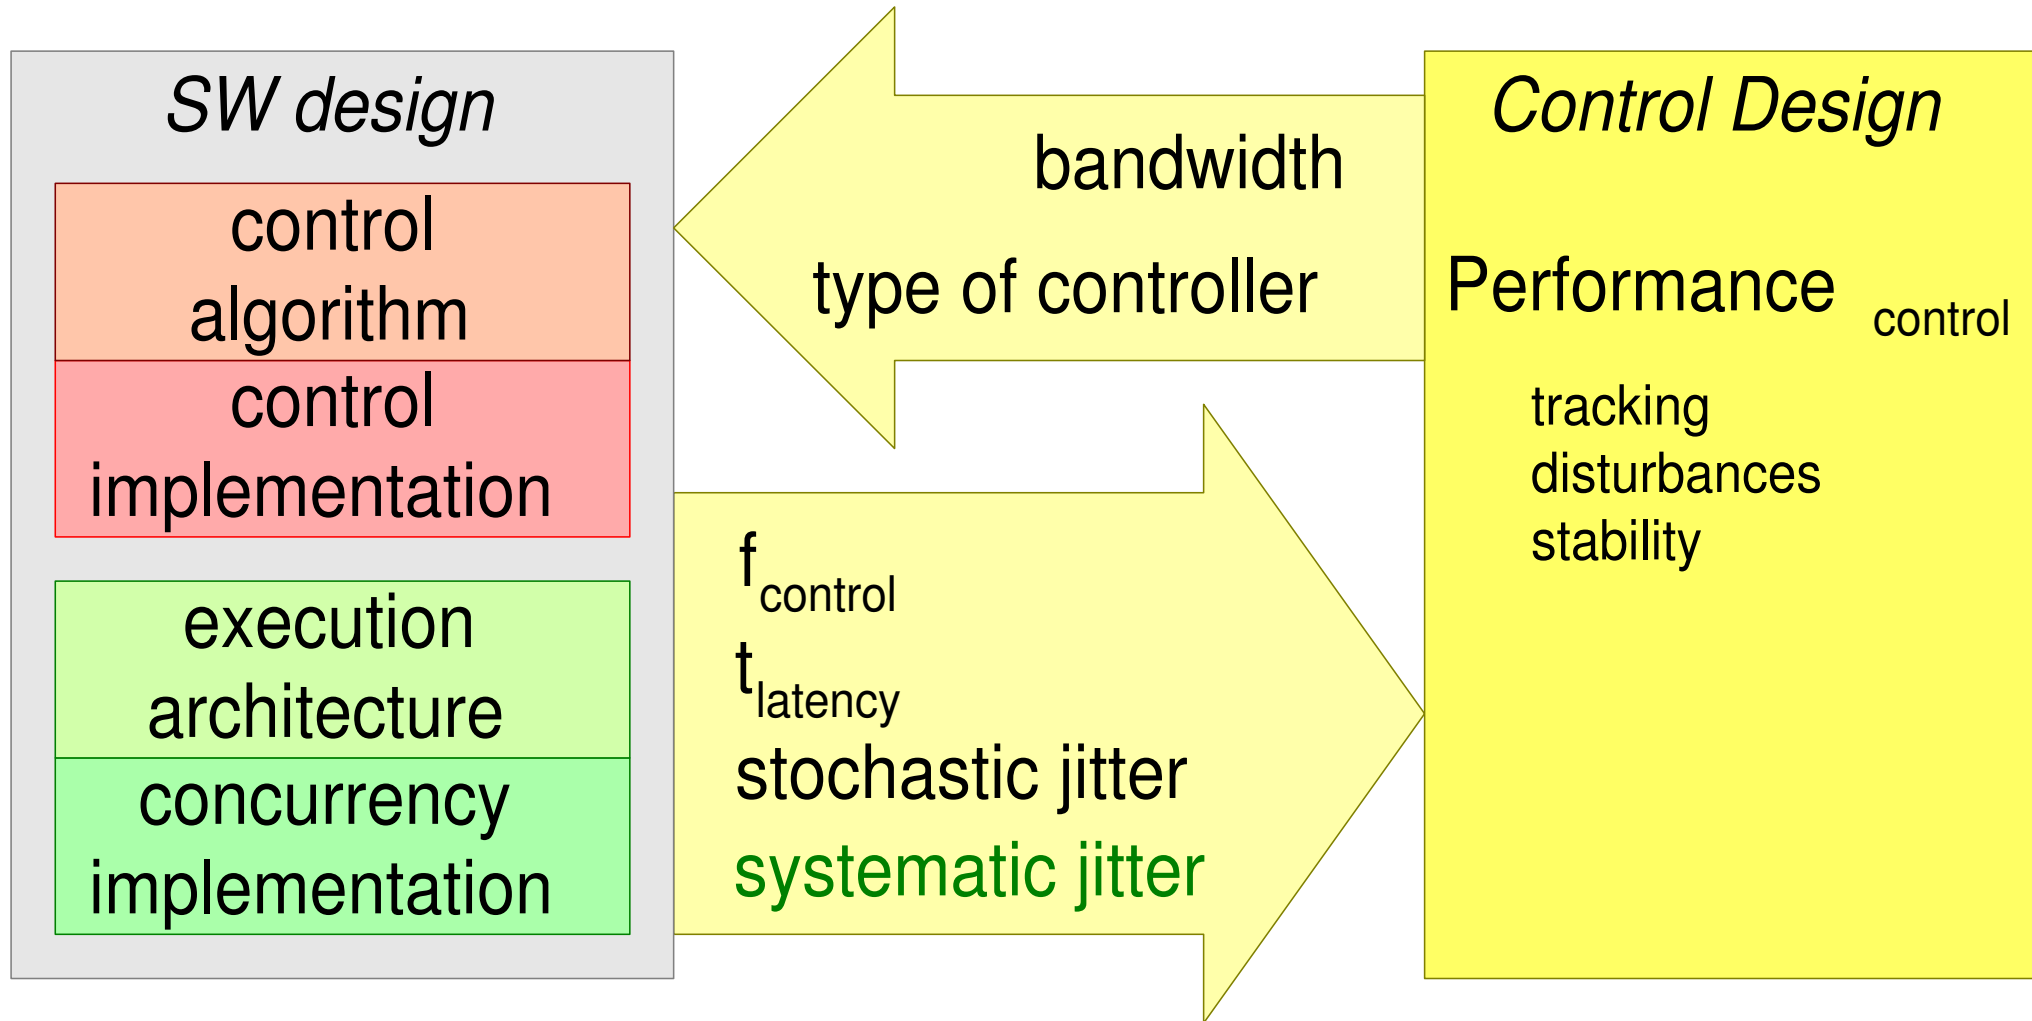

1^e order

impact of jitter on

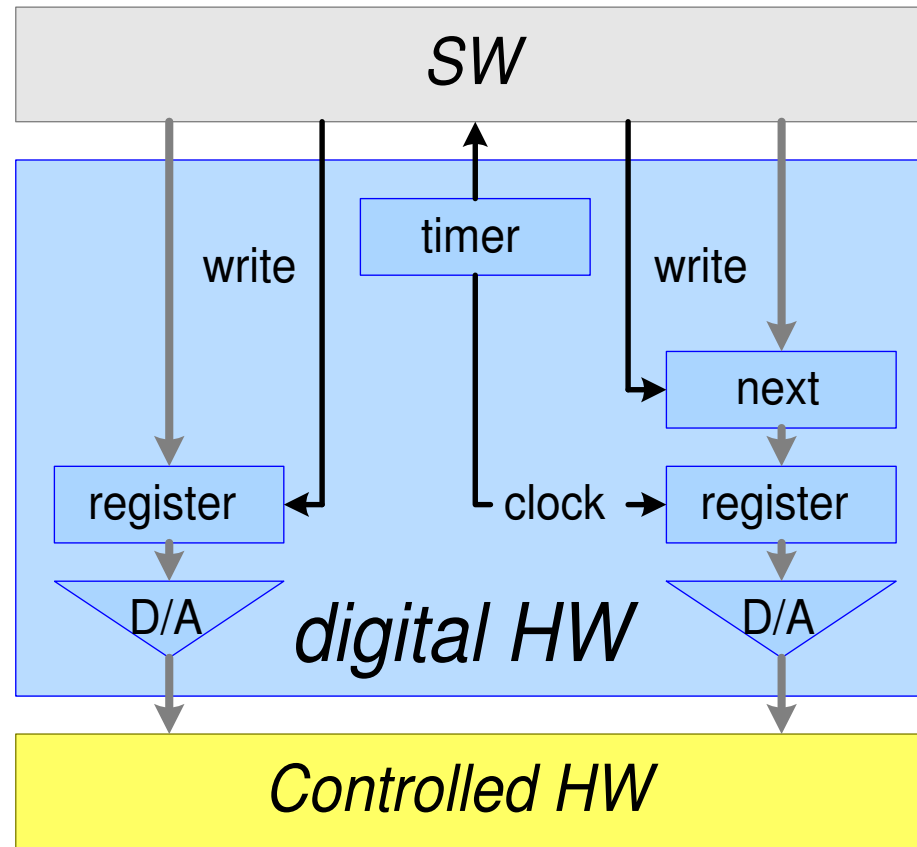

Performance_{control}

Mutual Impact of SW and Control Design

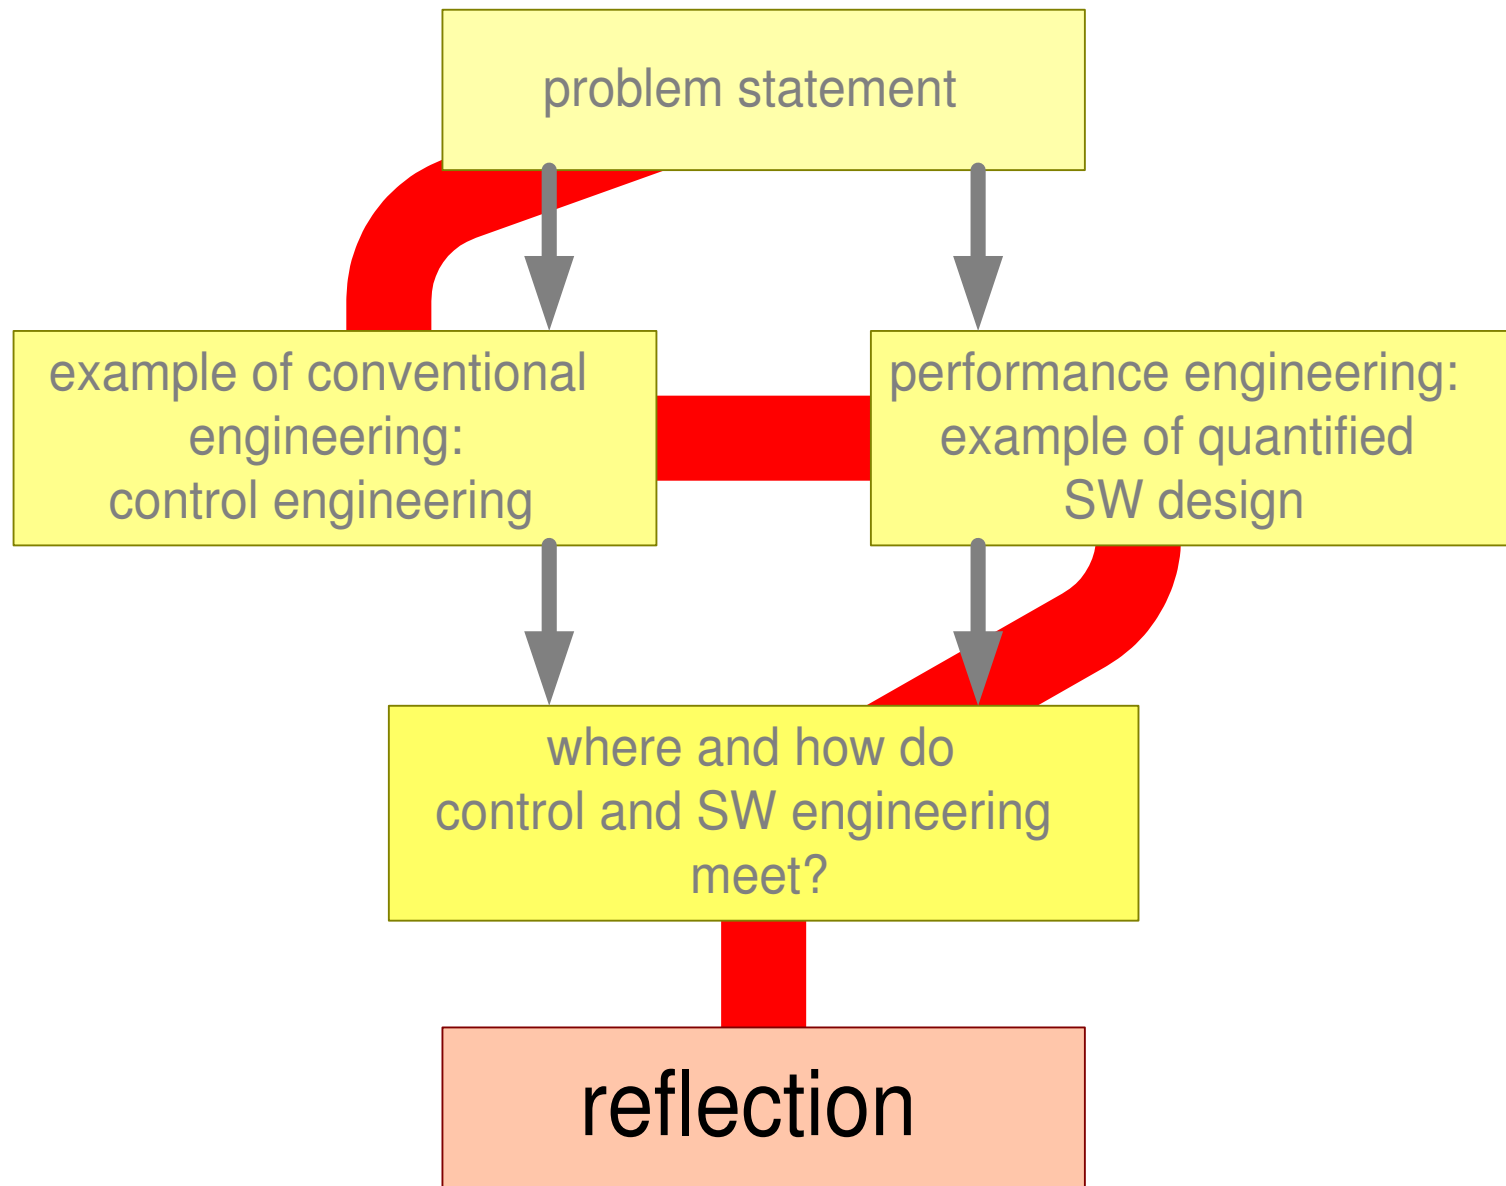

Impact of digital HW on SW and Control

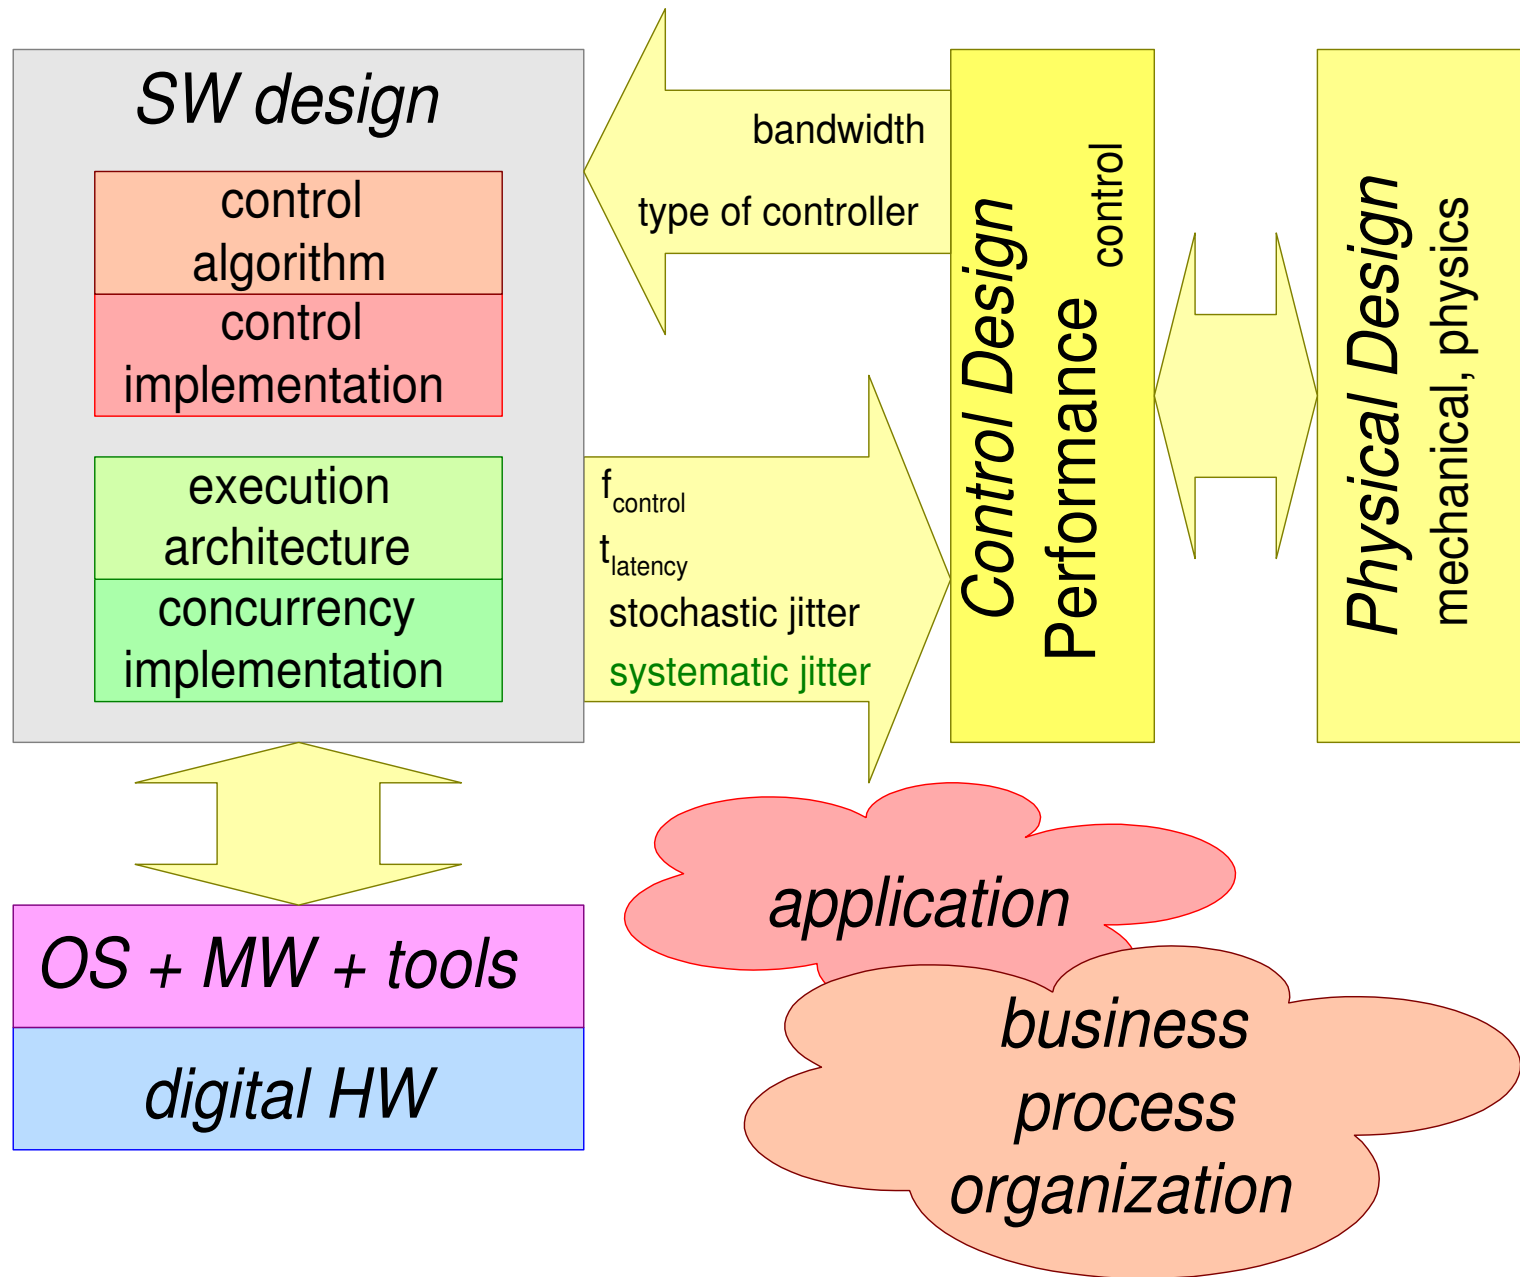

single buffered
SW impl. jitter
variable latency

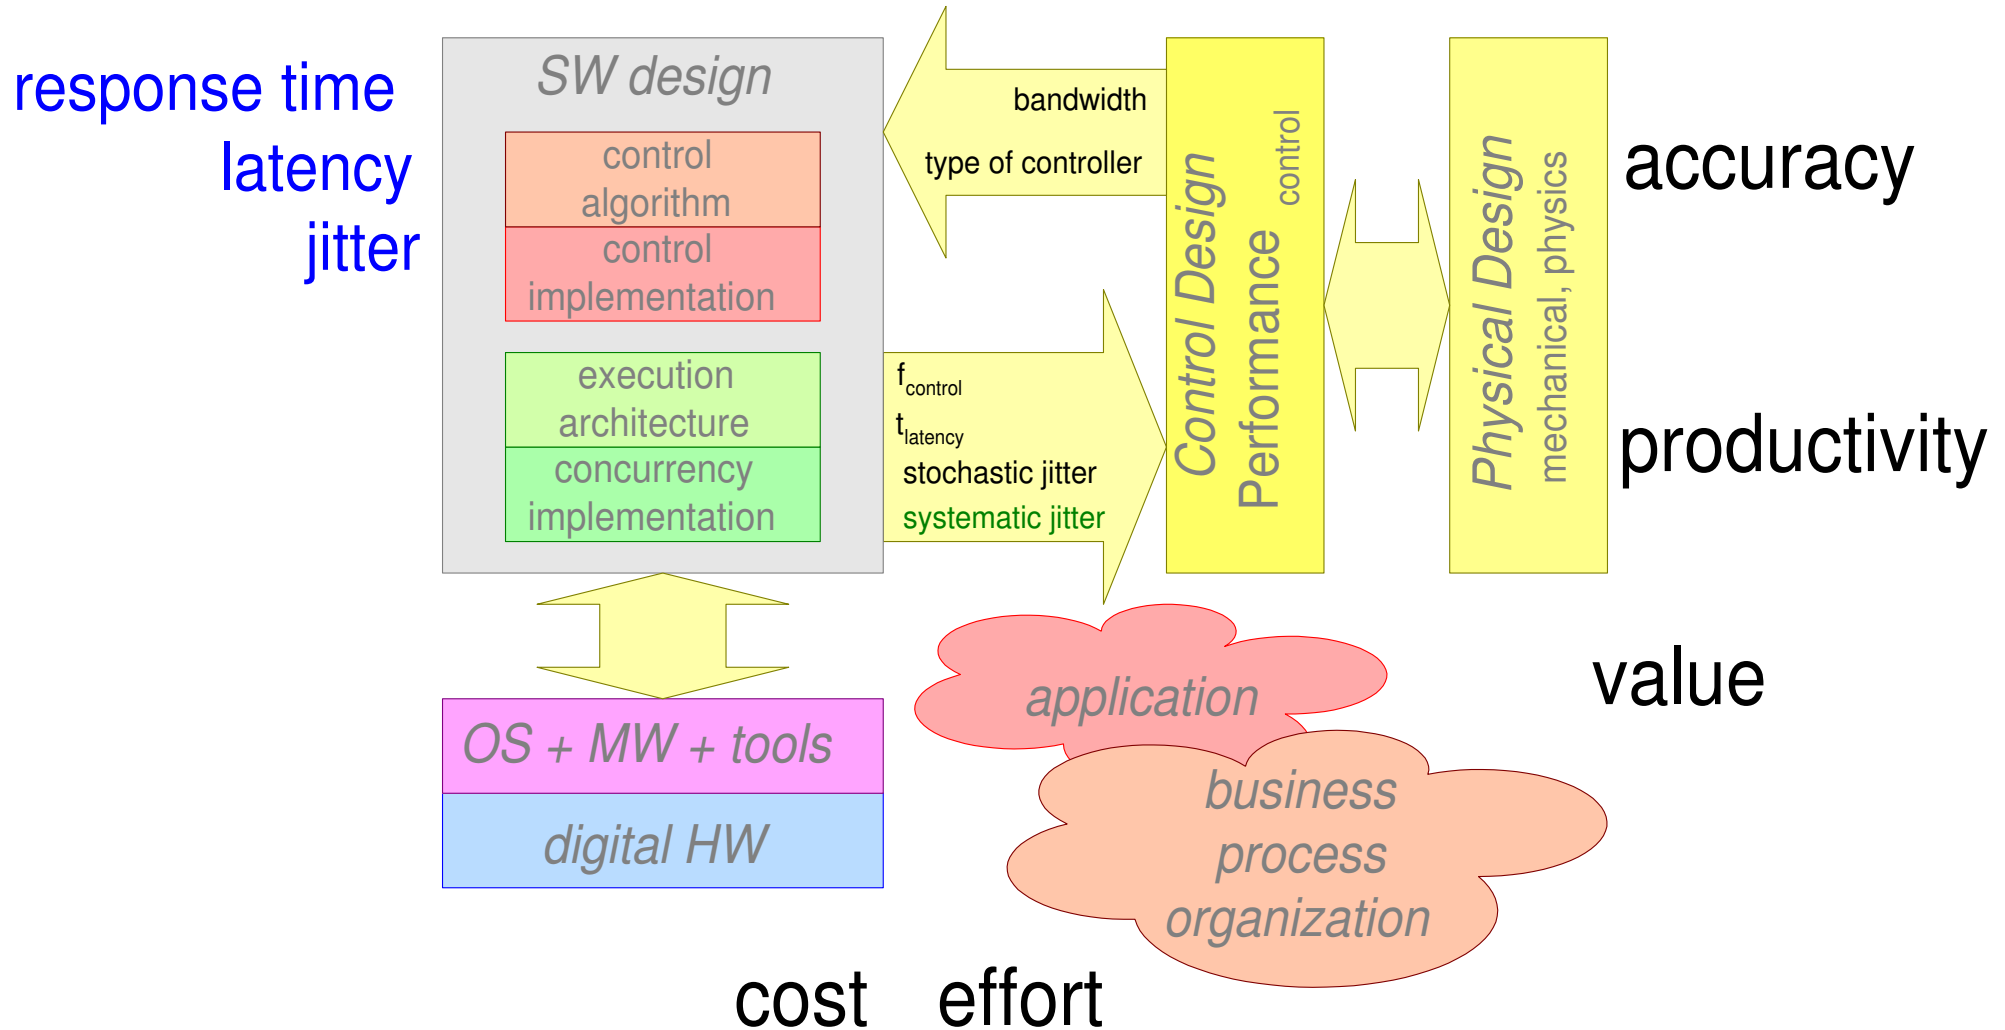

double buffered
jitter free
fixed longer latency

SW design = **Multi-** Multi- Disciplinary

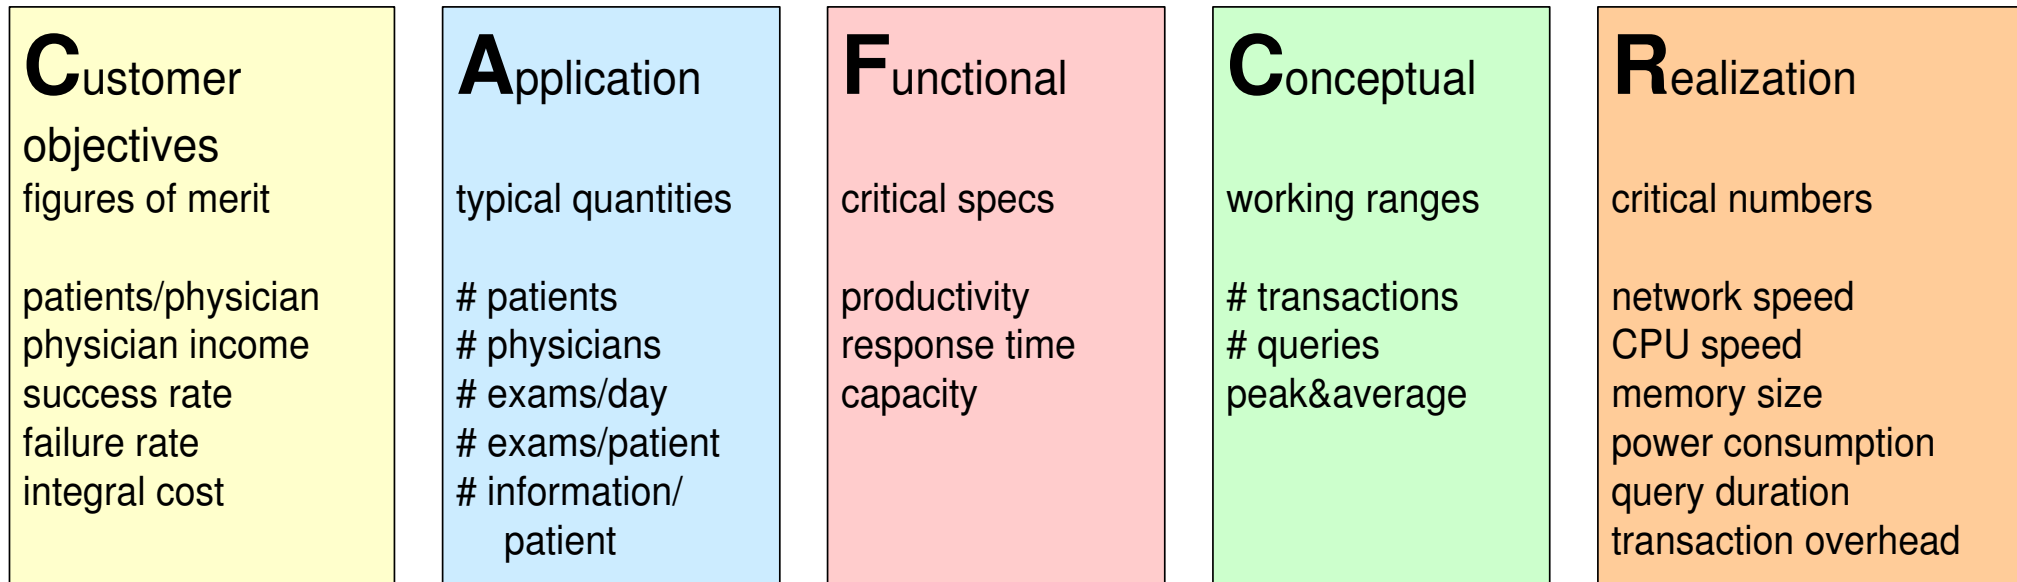

Quantifications Connect Disciplines

Questions?

After this slide some more quantification examples and issues are shown

Examples of Quantification; Electronic Patient Record

internal **O**perational view

market size	product life cycle	maintenance effort	# suppliers	effort	project size
market share	business model	update frequency	partners	cost	# engineers/discipline
growth rate	market segments	service crew	competitors	time	# teams

Where and When to Quantify

requirements analysis	paradigm boundaries application relevance design sensitivity
ranges and relations	typical, best, worst case dependencies
variation analysis	random vs systematic types of systematic variation time-base, rate of change
propagation analysis	amplification or dimming
evolution	application, business evolution technology evolution scaling, scaling boundaries

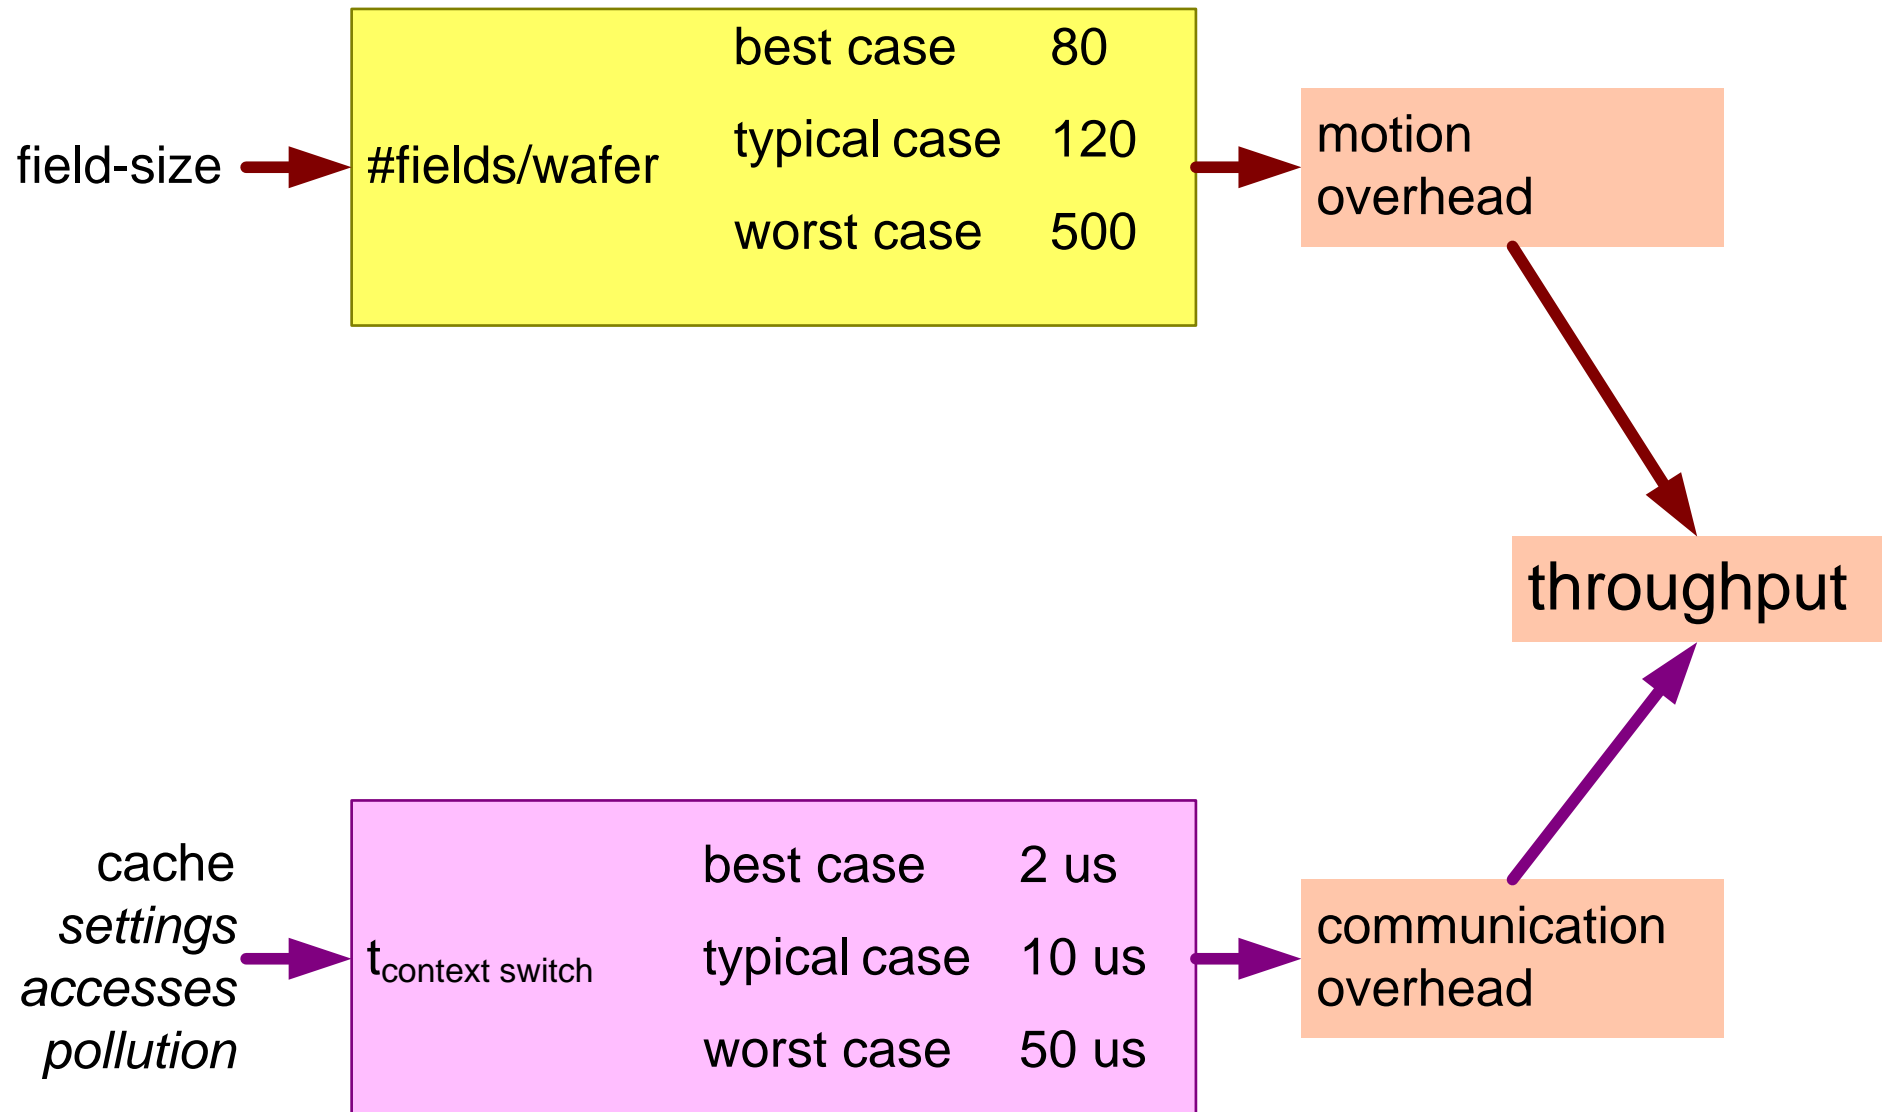

Example UI paradigms for Pictorial Index

meta-information directory

Example of Combining Heterogeneous Quantifications

Example Computer Crime quantification

http://www.usatoday.com/tech/news/computersecurity/infotheft/2006-10-11-cybercrime-hacker-forums_x.htm

- * \$67.2 billion: FBI estimate of what U.S. businesses lose annually because of computer-related crimes.
- * \$8 billion: Consumer Reports estimate of what U.S. consumers lost the past two years because of viruses, spyware and Internet scams.
- * 93.8 million: Privacy Rights Clearinghouse's count of personal records reported lost or stolen since February 2005.
- * 26,150: The Anti-Phishing Working Group's count of unique variations of phishing scams reported in August 2006.

Typical costs of goods and services in forums:

- * \$1,000 to \$5,000: Trojan program that can transfer funds between online accounts.
- * \$500: Credit card number with PIN.
- * \$80 to \$300: Change of billing data, including account number, billing address, Social Security number, home address and birth date.
- * \$150: Driver's license.
- * \$150: Birth certificate.
- * \$100: Social Security card.
- * \$7 to \$25: Credit card number with security code and expiration date.
- * \$7: PayPal account log-on and password.
- * 4% to 8% of the deal price: Fee to have an escrow agent close a complex transaction.
- * Free: Access to a service that gives details of the issuing bank for any credit card number.
