[www.gaudisite.nl](http://www.gaudisite.nl)

## Abstract

This course focuses on systems engineering in companies that are supplying to an OEM company. The assignments use a case and guide the participants through the V-Model for that case.

### Distribution

This article or presentation is written as part of the Gaudí project. The Gaudí project philosophy is to improve by obtaining frequent feedback. Frequent feedback is pursued by an open creation process. This document is published as intermediate or nearly mature version to get feedback. Further distribution is allowed as long as the document remains complete and unchanged.

# Create a Project Overview of the Case

Create a Project Overview for your case

*Project Title*

meta information, e.g. version, date, author, owner

*Project Goals*

- 3 to 5 specific and quantified objectives

*system context*

- sketch the next generation system
- indicate changes compared to the current generation system

*system of interest*

- sketch your next generation subsystem, module, or function
- indicate changes compared to the current generation subsystem

*Key Performance Parameters*

- 5 to 10 specific and quantified requirements

*project master plan with timeline*

- first light, prototype shipment, 1<sup>st</sup> SAT @OEM, 1<sup>st</sup> SAT @OEM's customer, start volume production

*other relevant project information*

# Homework; Discuss and Update Case Overview

Contact the project and team leaders.

Have a dialogue on the case overview.

Adjust the case overview.

Annotate where uncertainties are.

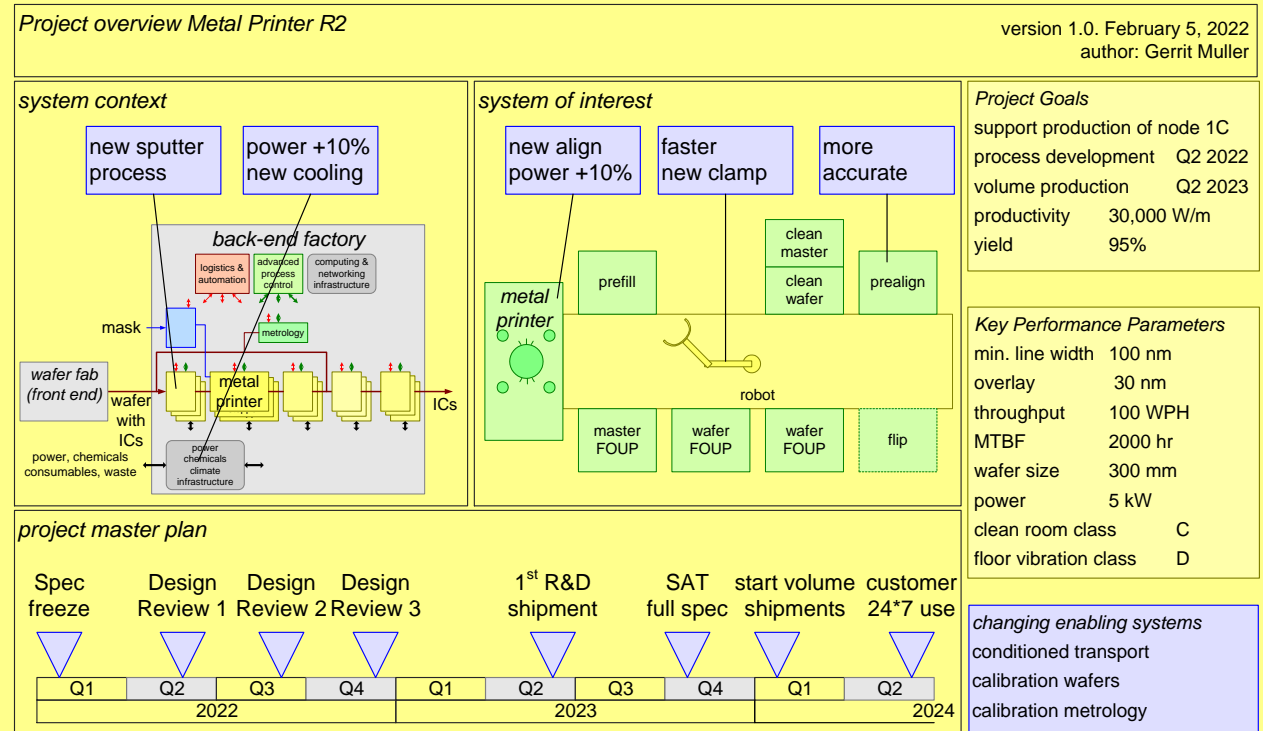

Create a Project Overview for your case		
<i>Project Title</i>		meta information, e.g. version, date, author, owner

# Case Introduction

Discuss the Project Overview

What are the most relevant project goals?

What are the main milestones and their timing?

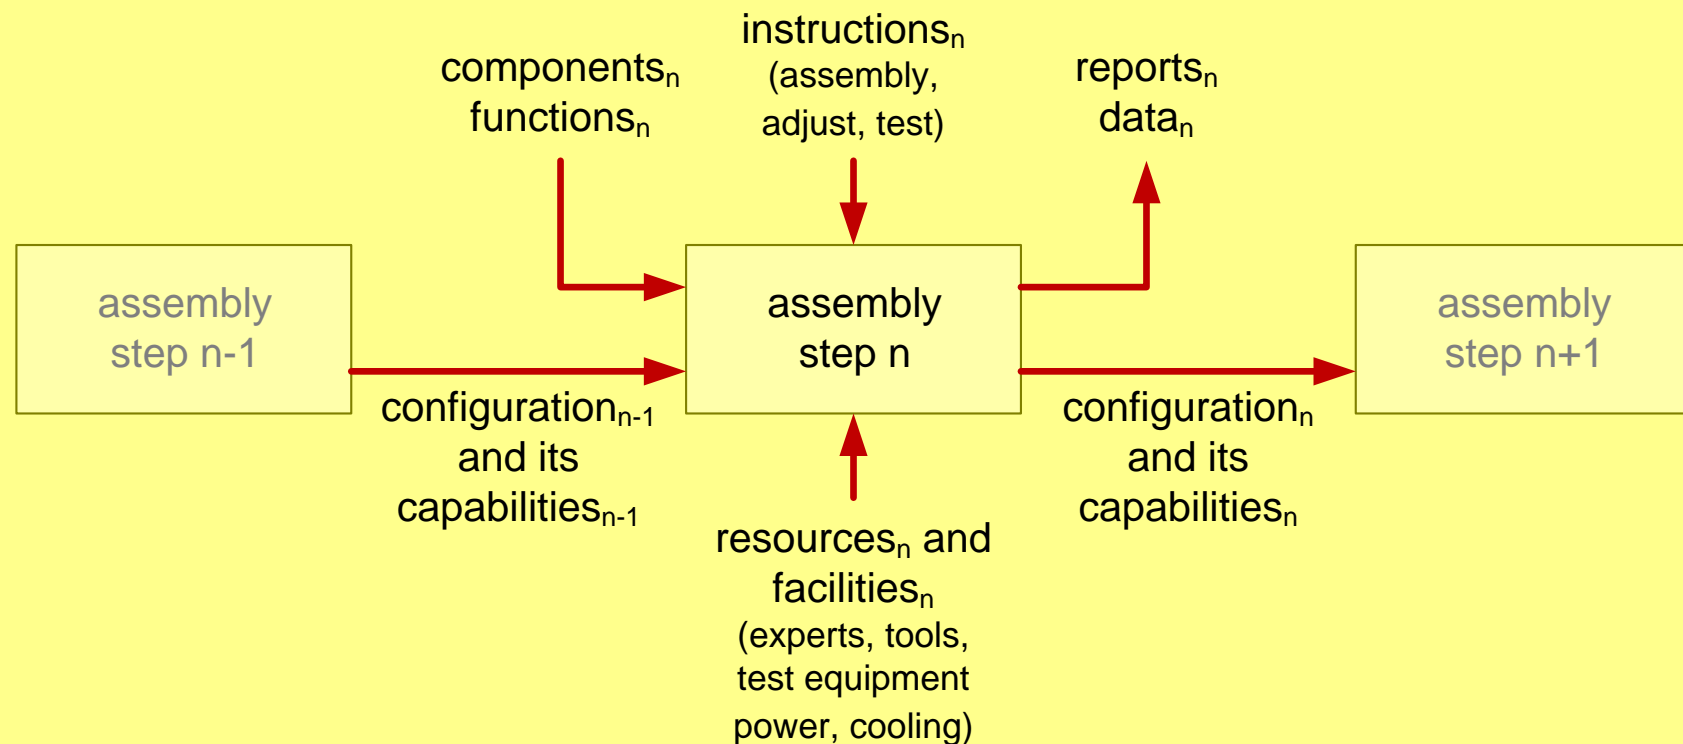

# Stakeholder Analysis

Identify ~10 stakeholders of the project

Determine per stakeholder their ~3 main concerns

stakeholders	concerns
sales manager	price, margin, value proposition
purchaser	purchasing price, delivery date
project leader	delivery date, resources, budget
developer	
integrator	
operator	
maintainer	
...	

Sketch a manufacturing ConOps of the current system

Sketch the installation workflow of the current system at the customer

Identify critical operations and prerequisites like tools and fixtures

# Homework; Elicit Needs from Stakeholders

Contact the major life cycle stakeholders in your company.

Have a dialogue on how they perform their role.

Capture their way of working in a ConOps.

Ask them for their main “pain” points.

## Concept of Operations (ConOps)

An envisioning of how the stakeholders will run their operation in relation to the system.

where (map)

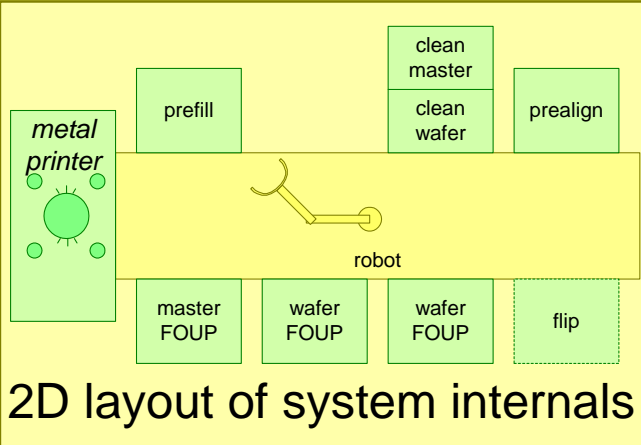

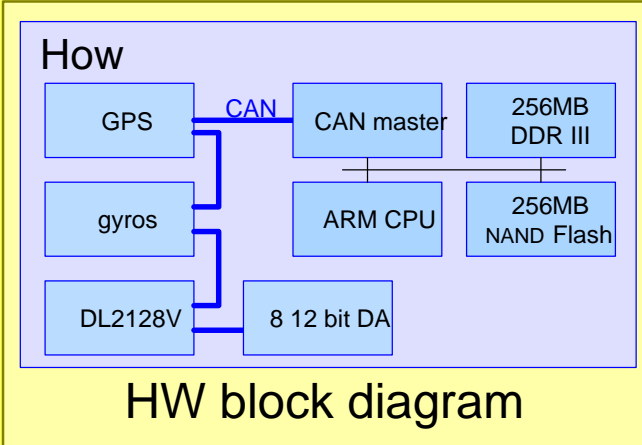

who (swimming lanes)

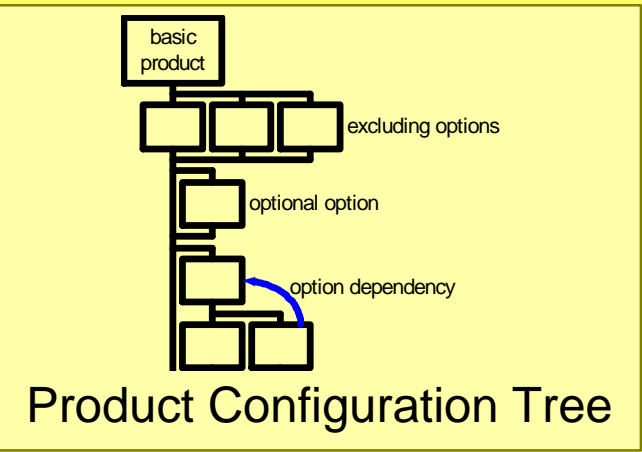

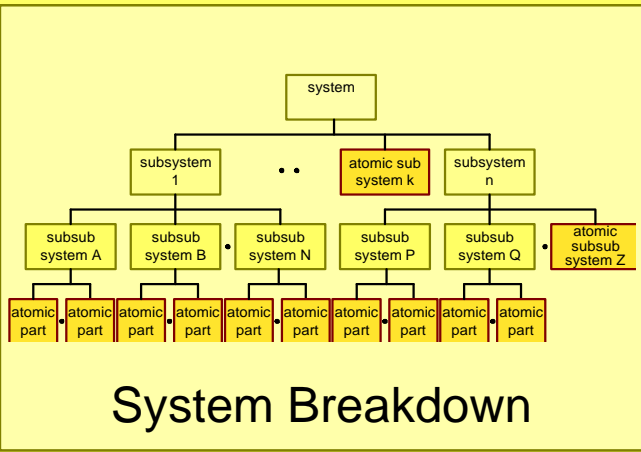

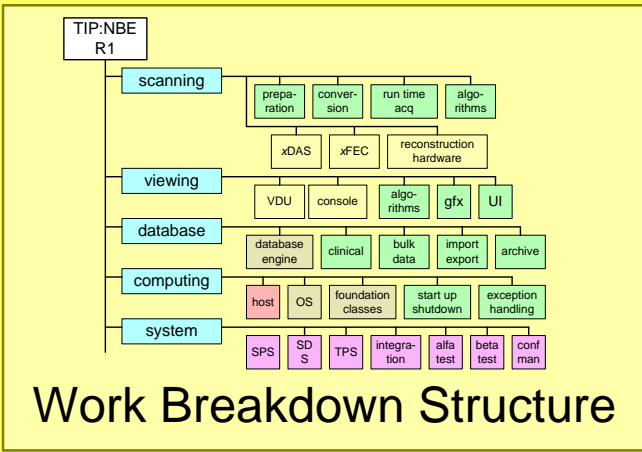

# Breakdown

Make a breakdown of your system. Choose 1 representation from below

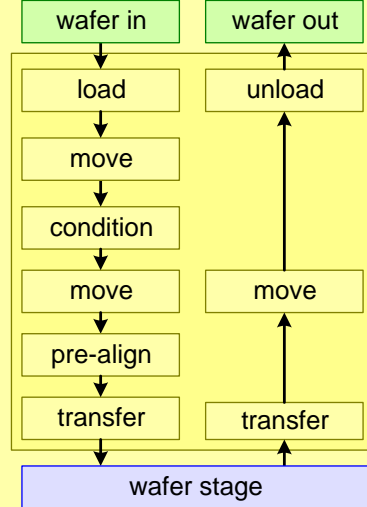

and select 1 representation from below

# Functional Analysis

Make ~3 functional diagrams showing the behavior of part of the system

*sequence diagram*

*feedback control*

*frequency response*

*light path*

*parameter as function of time*

*swimming lanes*

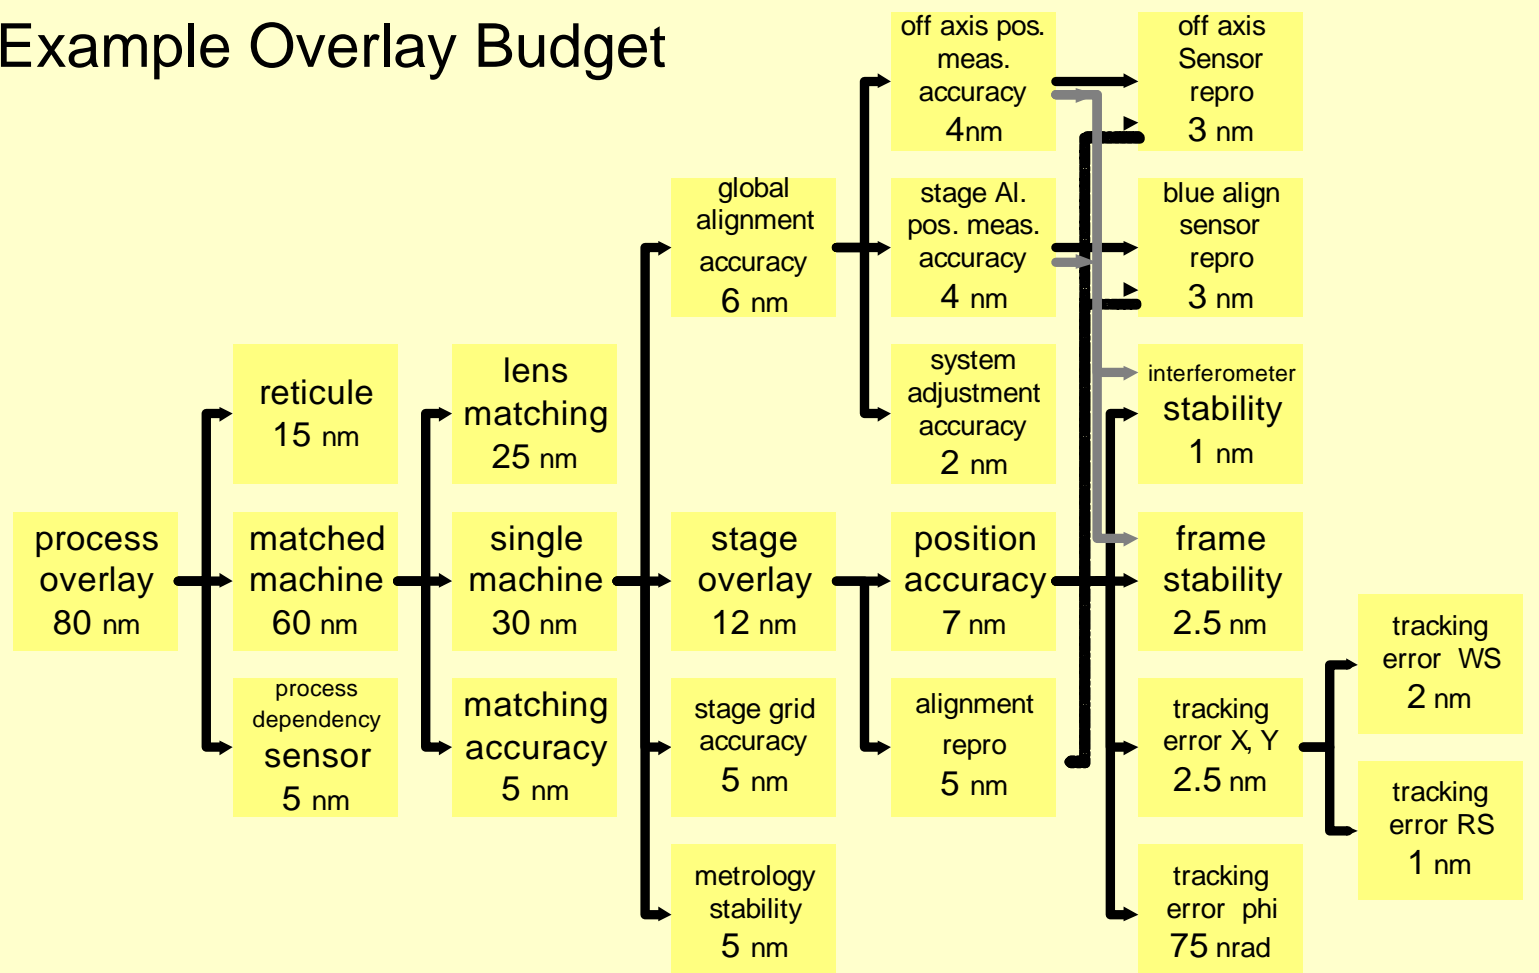

*state diagram*

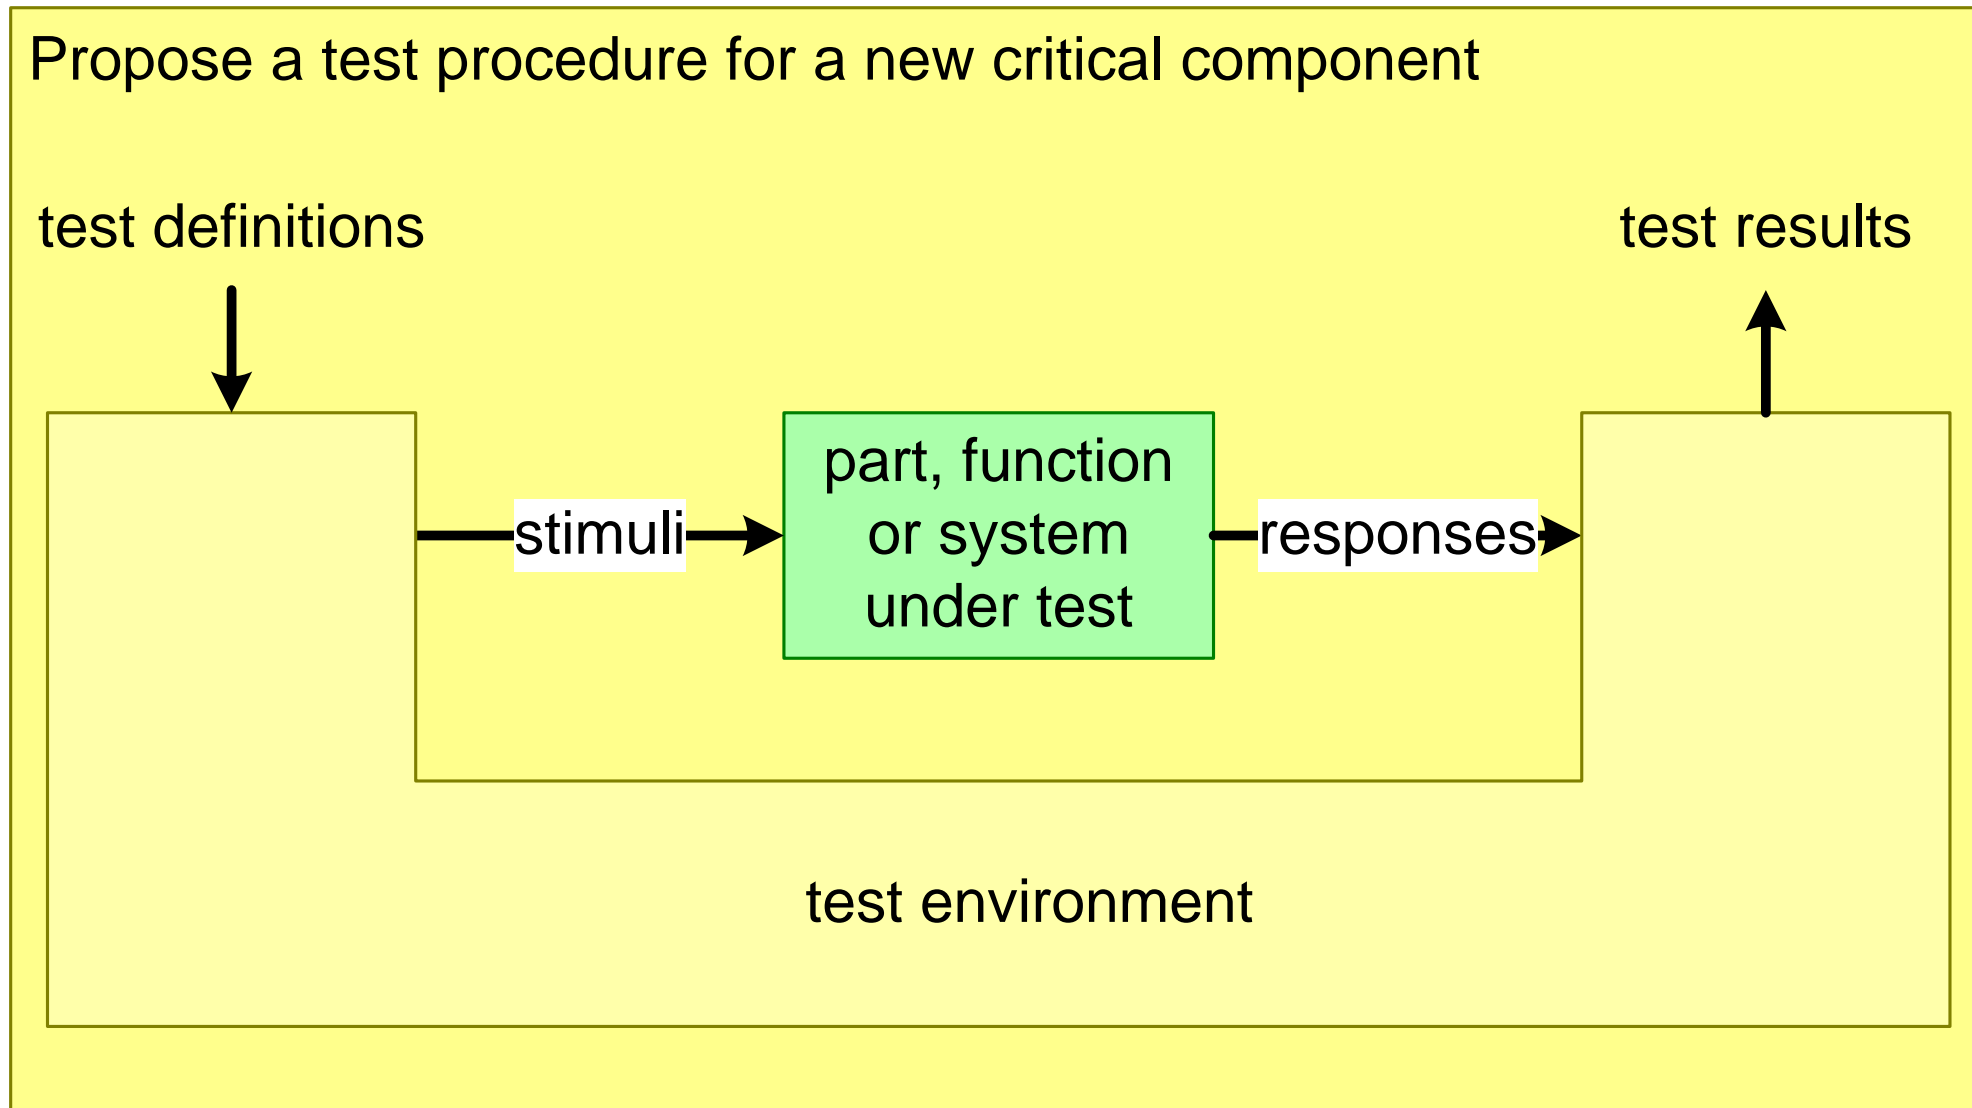

# Technical Budget

Make a technical budget, a breakdown of contributions, for one KPP

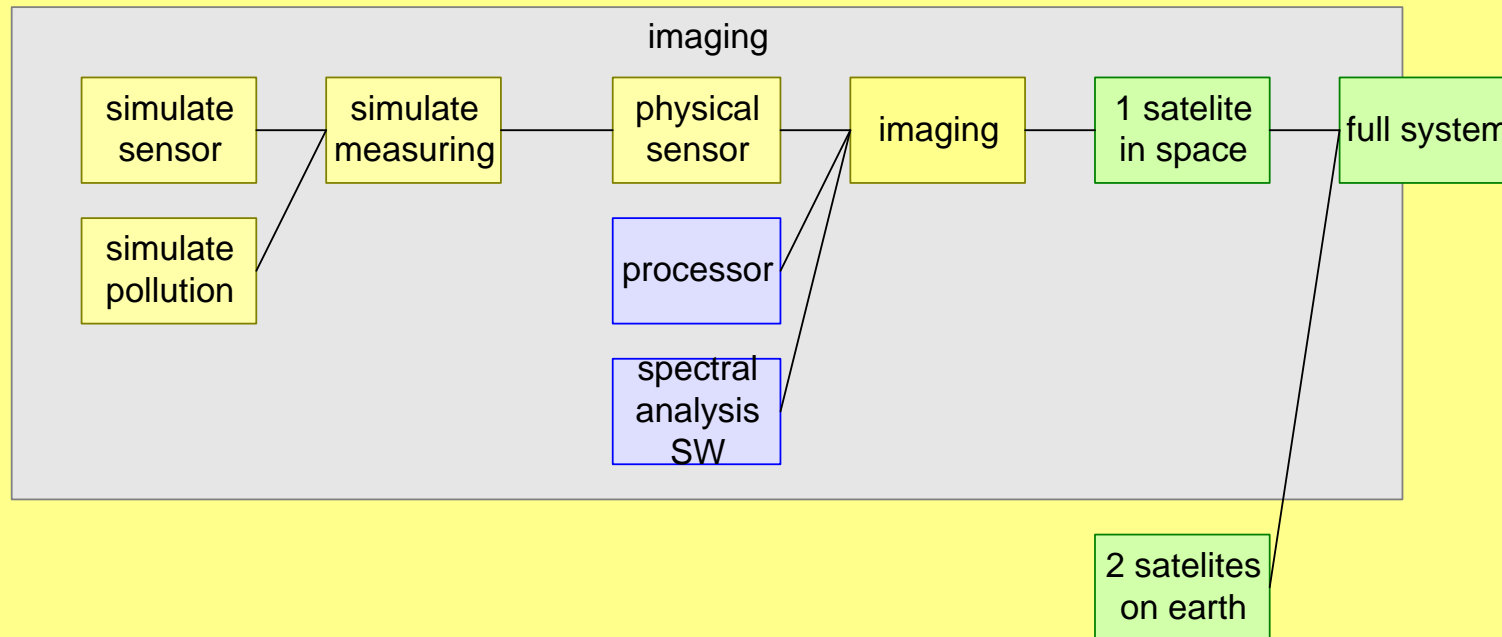

## Example Overlay Budget

# Testing and Verification

Propose an integration sequence that shows the KPP early

# Homework; Consult Colleagues

---

Consult your colleagues to determine and construct:

- the top 3 Key Performance Parameters of your (sub)system
- 3 views on dynamic behavior; how does your (sub)system achieve the KPPs?

# Case Presentation

Make a presentation for the Project Team to explain

- project overview
- master plan
- design
- verification & integration
- life cycle
