

Researching how to Connect Business and Customer World to Engineering World

Abstract

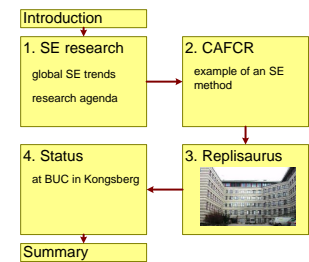

The purpose of most engineering activities is to create a system that satisfies needs of a customer and that satisfies business objectives. However, the engineering world is technical oriented, where technical decisions tend to be made on technical trade-offs. The business and customer worlds are social and economical by nature. One of the objectives of Systems Architecting is to make design decisions in the technical world that are appropriate in the social and economical world.

Our research first of all tries to understand the current practice. The longer term goal is to enhance the current practice such that we can teach methods and techniques that actually improve current practice. We use the CAFCR model as a model to understand current practice and as model to develop methods and techniques.

Distribution

This article or presentation is written as part of the Gaudí project. The Gaudí project philosophy is to improve by obtaining frequent feedback. Frequent feedback is pursued by an open creation process. This document is published as intermediate or nearly mature version to get feedback. Further distribution is allowed as long as the document remains complete and unchanged.
