Teaching Systems Engineering to Undergraduates; Experiences and Considerations

by Gerrit Muller Buskerud University College and Embedded Systems Institute

e-mail: gaudisite@gmail.com

Abstract

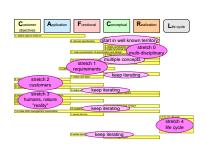

Undergraduates need a teaching style that fits their (lack of) experience. Especially in systems engineering this is an issue, since systems engineering connects to so many different stakeholders with so many different concerns. Students need to get aware of the inherent ambiguities, uncertainties and unknowns in the systems world, in contrast to the focused world of monodisciplinary engineering.

Distribution

This article or presentation is written as part of the Gaudí project. The Gaudí project philosophy is to improve by obtaining frequent feedback. Frequent feedback is pursued by an open creation process. This document is published as intermediate or nearly mature version to get feedback. Further distribution is allowed as long as the document remains complete and unchanged.

September 6, 2020 status: preliminary draft

version: 0.1

Mono-disciplinary Engineering Education

Well-defined problems

strength of bridge

Well-defined methods, techniques, formalisms

Bode plots in control

Questions have the right answer

bridge will sustain upto x ton control is converging and stable

Dominant teaching style: knowledge transfer and skill training

Subject of interest is technical

no unpredictable humans no inconceivable nature

Goals of Teaching SE at Undergraduate Level

to make students aware of

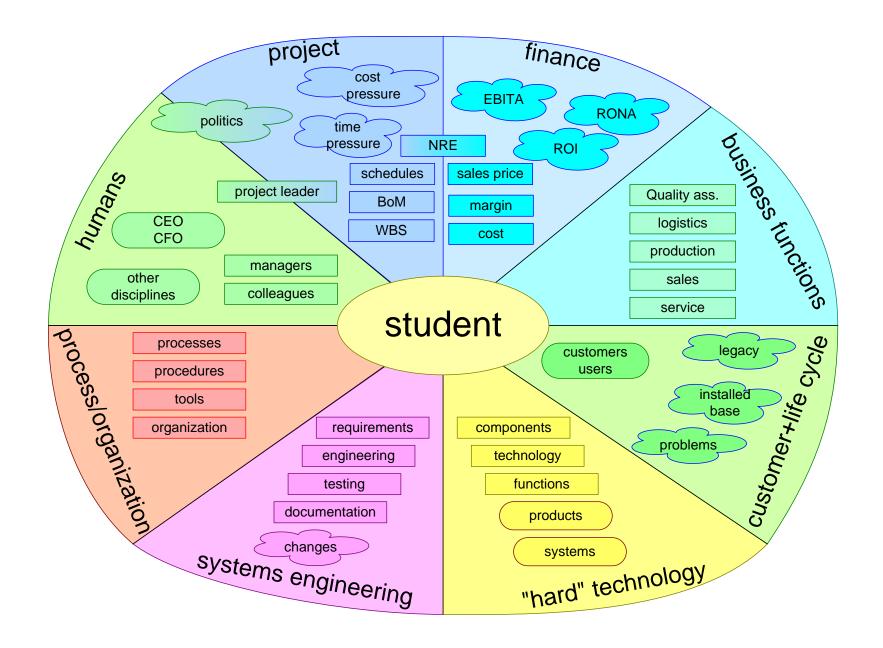

- + the impact of working in a large organization, e.g.

 processes, organizations, roles, responsibilities, economy and financials
- + the communication challenges between:
 various technical disciplines
 various less technical stakeholders
- + the ill-defined and multi-dimensional nature of system problems uncertainties, unknowns, ambiguities, dynamics, conflicting needs and goals
- + the impact of external conditions on the system and its design human behavior, natural phenomena
- + system life cycle

to provide insight in available methods, techniques, and concepts

The Context that a Student will Enter

The Challenge of Teaching Systems Engineering

Systems Engineering processes, methods, and techniques have a high "common sense" level.

Without experience they can easily be perceived as open doors.

How to get inexperienced students in a perceptive mode, such that they appreciate the subject matter?

Role Play as Teaching Paradigm

management team

process

organization

people

business, finance

design team

customer understanding

requirement specification

concept selection

partitioning, interfaces, functionality

qualities, e.g. performance, cost, reliability

technology choices

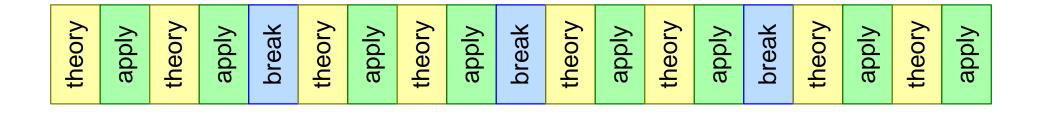

teams of 3 to 5 students per team

guided process:
some theory
apply in role play
brief reporting and
discussion

case that relates to their knowledge

Didactic Model

time-box

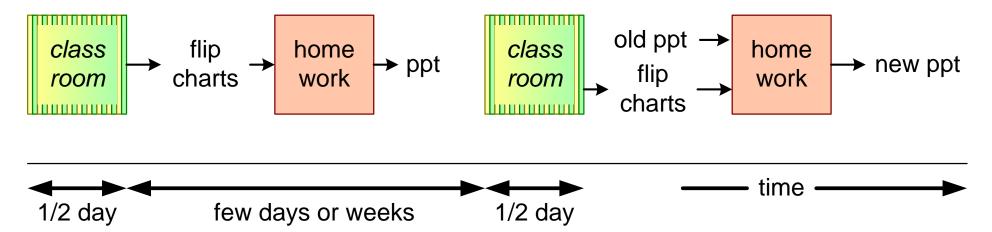

A time-box is a fixed amount of time allocated to perform one activity.

iteration

We iterate many times over different viewpoints. Every viewpoint is addressed multiple times with new insights from other viewpoints

Didactic Model; Homework

this didactic model is very intense students are exhausted after 1/2 day

class room

Small steps on flip charts

(or paper)

homework

consolidate results in

PowerPoint or Visio

Case Requirements and Example

case requirements

multi-disciplinary aspects

original discipline of students should be clearly present students must have some affinity with the application

open definition: unclear problem, large solution space

Example: Tree Cutting Robot for mechanical engineering students

mechanics is dominant vision and control require electronics and software

Less young people are willing to work in the wild and mountainous areas in Norway, Canada, or USA to cut trees for wood production.

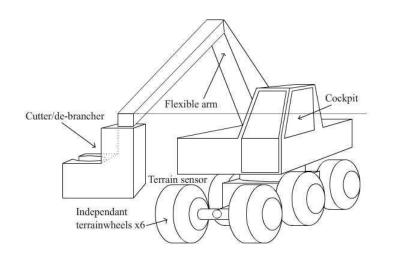

product:

background:

Robot that supports the cutting and processing of trees so that less people are needed.

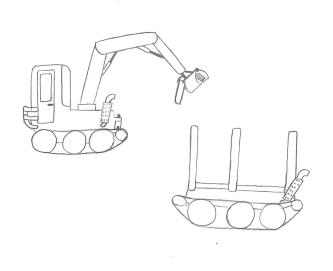

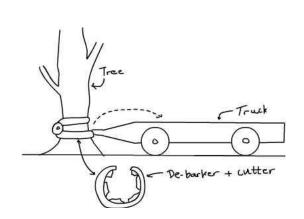

Example Designs of Tree Cutting Robot

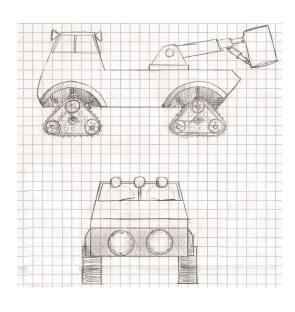

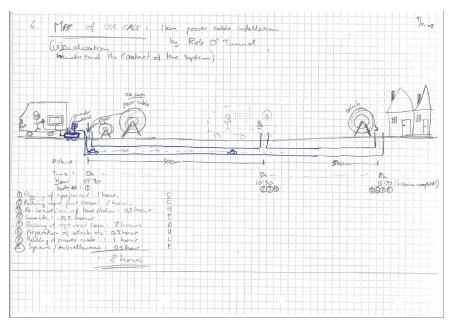

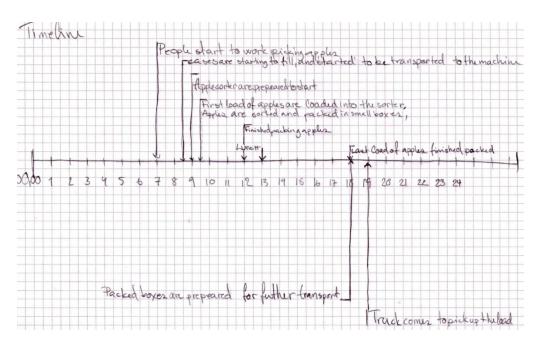

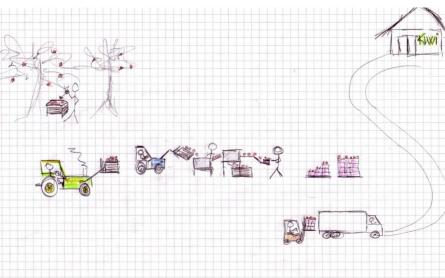

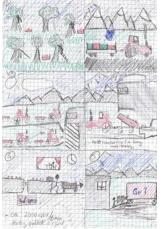

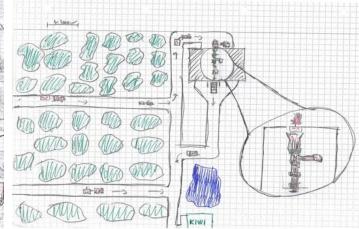

Example Stories of Apple Plucking Robot

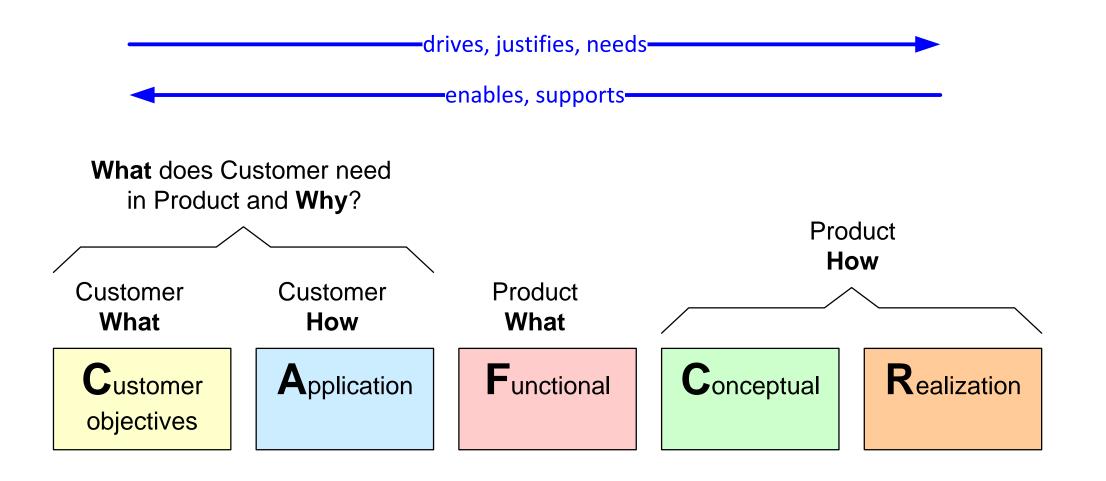

Class Room Fills itselfs with Flip Charts

Material for Design is Based on CAFCR+

CAFCR+ Model

Customer objectives

Application

Functional

Conceptual

Realization

operations maintenance upgrades

Life cycle

development manufacturing installation

sales, service, logistics, production, R&D

Steps for First 2 Sessions

Customer objectives

Application

Functional

Conceptual

Realization

1. select case to work on

2. discuss possible solutions

3. discuss specification

4. make design

5. make construction decomposition

6 make functional design

7. make presentation of specification and design

8 make second and third design

9 compare three designs

10. make list of design criteria

11. make list of design choices

12 update specification

13 define performance use case

14 specify performance

15 make performance model

Steps for Second 2 Sessions

unctional Customer Realization Conceptual **A**pplication objectives 1 make core spec 2. why are these specifications needed 3. describe usage 4. make key driver graph 5. make story 6 make use case(s) 7. analyze design impact 8 assess story based on 5 story telling criteria 9 improve story 10. improve key driver graph 11 make cost of ownership model 12 explore alternative designs 13 update specification 14 make draft management presentation

Last Session

Customer objectives

Application

Functional

Conceptual

Realization

Life cycle

1 specify life time

2 draw dev. life cycle

3 describe logistics and manufacturing

4 describe installation and acceptance

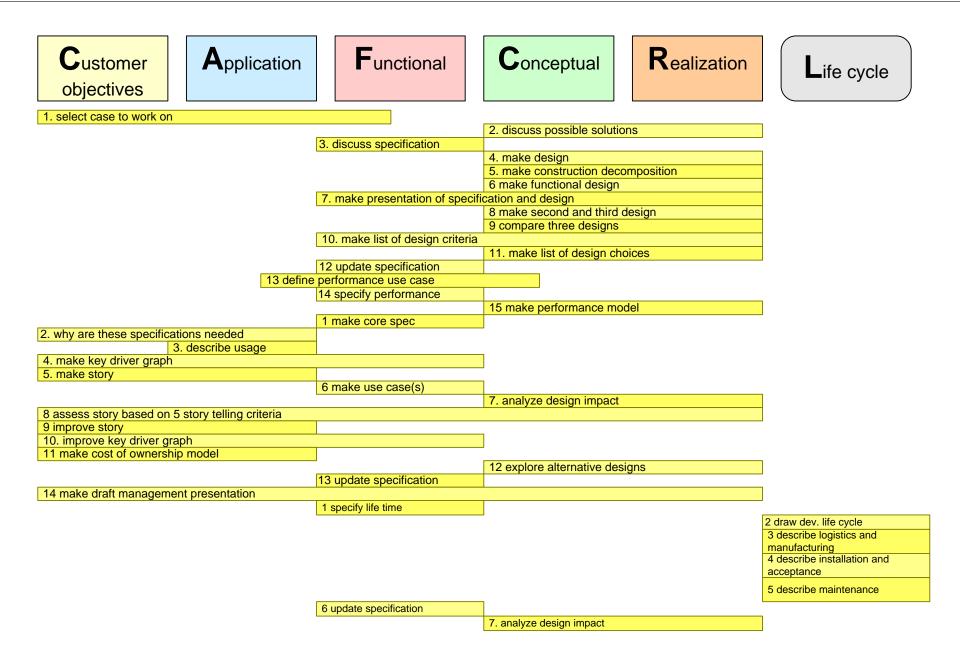

5 describe maintenance

6 update specification

7. analyze design impact

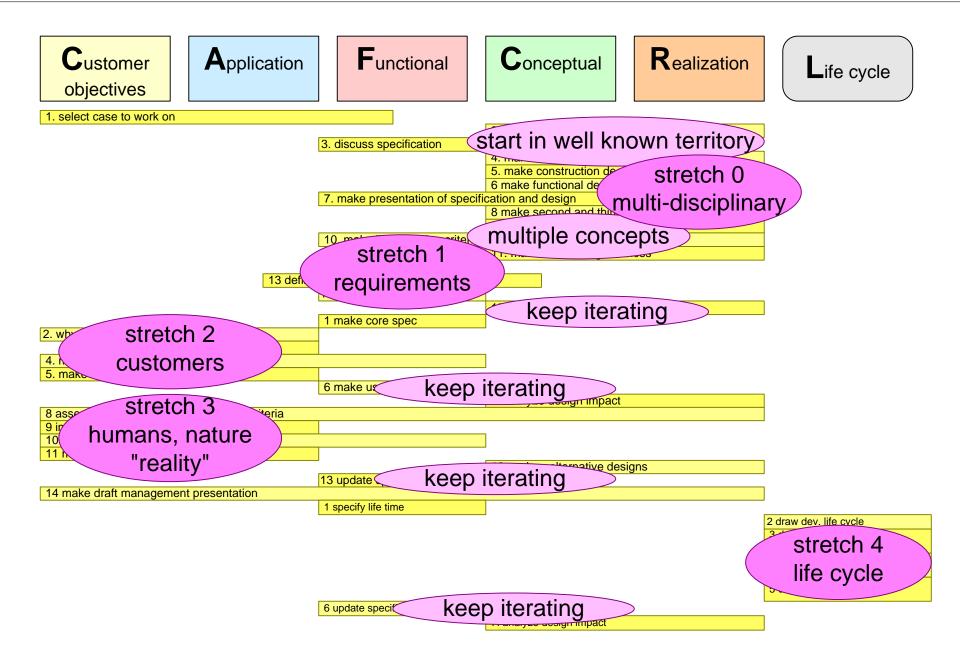

Summary of all Steps

Stretching from Comfort Zone into Unknowns

Role of the Teacher

Guides the students through a journey.

Stretches students one step at a time.

Regularly forces students out of their comfort zone.

Provides feedback on their intermediate deliverables.

Helps students to reflect on their experience.

Provides theory JIT (Just In Time: appreciation and application).

Illustrates theory with examples from practice.

Keeps the pace high.

Initiates frequent breaks (this approach costs lots of mental energy).

Unfreeze students: let them sketch, stimulate creativity and imagination

Experiences of Teaching in this Way

The sessions can be a lot of fun for students and teacher.

Some interesting concepts pop-up.

The increase of awareness can be observed.

Some nice visualizations or animations are shown.

Time-boxes can vary from 5 to 20 minutes.

Sometimes a few steps have to be skipped.

Too funny concepts or stories distract.

Teams that get stuck in unrealistic proposal.

Students that miss sessions; participation is mandatory.

Teams that stick to the initial solution
