Abstract

Requirements play a driving role during product creation. The requirements are captured in a requirements specification. How can we assess the requirements specification? What are the criteria for a good specification? We discuss these aspects by positioning the requirements specification in the broader context of customers, market, product creation and product life-cycle. We zoom in to the software requirements specification, to discuss the criteria for this mono-disciplinary specification.
Did you ever program a VCR?

A depressed

B desperate

C hysterical

What is a Good Requirement Specification?
Example Time Shift recording

20:00
start movie
view
phone rings
pause viewing

21:00
broadcast
record
play
talk

22:00
end movie
view
finish conversation
resume viewing

23:00
start
movie
Construction limits intrude in User Experience

- number of tuners
- number of simultaneous streams (recording and playing)
- amount of available storage
- management strategy of storage space
What if?

1. programmed recording of other station
2. very long phone call
3. Dad zaps

What is a Good Requirement Specification?

1.1
Software Requirements

1.1.1 Real-time data requirements
   1.1.1.1 Access to the non-real-time data must be done in such a way that it does not interfere with the real-time data
   1.1.1.2 There must be no disruptions in output of video signal during the operation of VCR
   1.1.1.3 Responsiveness for non-real-time data is less than 150ms (the time for writing a block on HDD) for 2KB of non-video data

1.1.2 Implementation detail
   1.1.2.1 Management of HDD content must only be possible through the TOC in order to prevent unauthorized access to content of HDD
   1.1.2.2 Visual feedback is provided to the user via On-Screen Display
   1.1.2.3 User input is provided via the RC

1.1.3 Non-real time data requirements
   1.1.3.1 User must be able to pause and unpause a title, played from HDD, while (s)he is watching it
   1.1.3.2 User can jump forward and backward in a title, from HDD, during watching of this title
   1.1.3.3 Names of titles should be derived from the information from the EPG (name of the program to be recorded, time and date of registration)
Key Success Factor: Feedback

Obtain feedback from real users:
- Observe
- (Dare to) Listen
- Experiment
- Use short development cycles

Don't stay in the development lab
Criteria for a Good Requirements Specification

A good requirements specification:

- reflects the real needs of all stakeholders
- describes a feasible product
- answers most critical design questions
- is useful for human product creators

especially customers

implicit, latent

sales
manufacturing
logistics
service

simpllicity

i.e. more than hard factors!

non-linear choices

discrete options
(e.g. hard disk vs flash memory)

SMART, but also
understandable
accessible
Multiple Viewpoints to Understand Needs and Feasibility

- **top-down**
  - key-drivers (customer, business)
  - operational drivers (logistics, production, etc.)
  - roadmap (positioning and trends in time)
  - competition (positioning in the market)
- **bottom-up**
  - regulations
  - "ideal" reference design (learning vehicle)
  - prototyping, simulation (technological opportunities)
  - existing systems

- Needs
- Continued Product Creation Process
- Feedback

REQviewpoints
How SMART can requirements be described?

**fuzzy stakeholders**
- User Experience
- Context: social, cultural, mental etcetera
- Heterogeneous Implementations
- other stakeholders in the value chain

**smart operation**
- Product Creation
- Sales Service
- Order Realization
- other stakeholders in the value chain

**user**

**marketing**

**Stakeholder interests**
Requirements must be SMART and Usable

- Accessible
- Understandable
- Low threshold

- Specific
- Unambiguous
- Verifiable
- Quantifiable
- Measurable
- Complete
- Traceable

**fuzzy stakeholders**

**smart operation**
When SW engineers demand "requirements",
then they expect \textit{frozen} inputs
to be used for
the design, implementation and validation
of the software.

VREQsoftwareSubsystem
And why is it never up-to-date?
Conclusions and Recommendations

Never wait for the software requirements specification to be complete

1) it is never complete
2) it is never up-to-date
3) the product will be too late.

Be creative to cope with uncertainty and dynamics

for instance, use prototype as specification "WYSIWYG"

use incremental development strategies (XP, EVO, ...)

focus on most important and critical issues
